#### INTRODUCTION

The continental shelf waters of Surinam (South – America) are heavily influenced by the nutrient- and sediment-rich outflow of major rivers. Atlantic seabob shrimp Xiphopenaeus kroyeri (Crustacea: Penaeoidea) (Heller, 1862) occurs abundantly in this area and is fished by a fleet of 20 otter-trawlers, catching some 10.000 tons/yr. for export to the US and Europe. Due to regulating measures, mainly regarding by-catch and fishing ground restrictions, the seabob fishery in Surinam was awarded an MSC-ecolabel in 2011. Together with a smaller artisanal fleet providing the local market- seabob fisheries are an important economic activity in the coastal area, generating considerable foreign income and constituting an important domestic protein supply in Surinam.

### **PROBLEM**

Survival of the fishery is directly dependent on the availability of wild seabob shrimp to catch.

Stock assessment (Medley, 2009): seabob populations are healthy and not overfished, but ecology remains largely unknown.

- → Distribution in the coastal area: which environmental parameters are important?
- Trophic role of the seabob: what is the effect of seabob removal on other species in the foodweb?
- > Impact of fishing gear: is seabob trawling altering benthic habitats?

# Does current fishing compromise future catches or severely impact the marine environment?

### **LOOKING FOR ANSWERS: BIO-ENVIRONMENTAL RESEARCH**

## 2012: Distribution and foodweb study

- Monthly sampling campaigns
- 18 locations between 5 and 40 meters depth
- Otter- trawling: spatio-temporal distribution of seabob
- Environmental parameters: CTD, Chl a, suspended organic matter, turbidity, sediment
- Foodweb analysis: fish stomachs and stable isotopes
- Macrobenthos samples

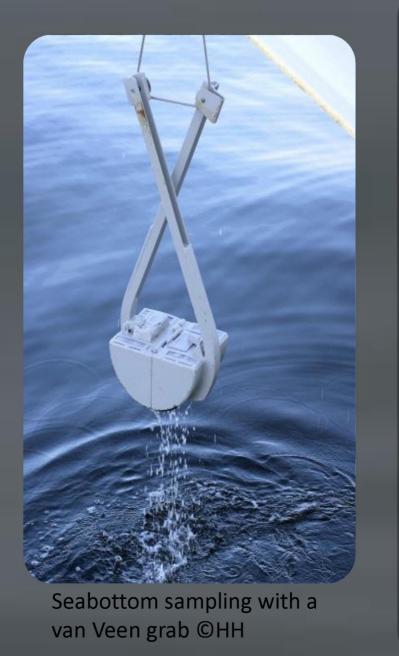

### 2013: Impact of fishing gear on benthic habitats

- Trawling experiments in untrawled areas
- Comparison of trawled versus untrawled areas, based on data from VMS-tracking (Vessel Monitoring by Satellite)

The fishery should remain operating, minimizing its environmental impact and ensuring its sustainability. Research results will be integrated in practical, but ecologically sound management advices to the fishing industry, which is, together with the local government authorities involved from the start in this project.
