Statistical tables and charts

List of tables

1.1	UK summary table	<i>page 3</i>
2.1	UK fishing vessels by their department of administration	7
2.2	Main activity of the UK fishing fleet, by segment	9
2.3	UK over 10m fleet by licensing district 1993-1995	10
2.4	UK fishing vessels (over 10m) by vessel length groups	11
2.5	Age of UK vessels (over 10m)	14
2.6	Producer Organisations membership for 1993 and 1994	18
2.7	Number of fishermen	19
2.8	Number of fishermen by district	20
3.1	Fish landings by the UK fleet	28
3.2	Fish landings in the UK	30
3.3	Fish landings in the UK and abroad	31
3.4	Landings at major ports and districts	39
3.5	Major Ports in 1995	48
3.6	Landings by foreign fishing vessels in 1995	52
3.7	Landings abroad by UK fishing vessels in 1995	55
3.8	Landings by area of capture	58
4.1	Balance sheet for the UK	68
4.2	Imports of fish and fish preparations	72
4.3	Exports of fish and fish preparations	75
4.4	Imports by exporting country	78
4.4	Exports by country of consignment	84
4.6	Imports of fish products	90
4.7	Exports of fish products	92
4.8	Consumption in the GB	94
4.9	Consumption in the GB (historical data)	94
4.10	Average annual values of fish	95
4.11	Quantity and average prices of selected species (landed weight)	96
5.1	Main stocks and their status	100

6.1	World catch figures by nationality of vessels	106
6.2	World catch by species group	109
6.3	World catch by sea area	109
6.4	Marine catch by the principle countries fishing in non-adjacent fishing areas	110
6.5	1995 Total Allowable Catches, quotas and uptake	117
6.6	European Union fishing fleet as at 31 December 1995	151
A2.1	Quantity, value and price of cod by presentation and grade	160
A2.2	Quantity, value and price of haddock by presentation and grade	165
A2.3	Quantity, value and price of monks (anglers) by presentation and grade	170
A2.4	Quantity, value and price of saithe by presentation and grade	175
A2.5	Quantity, value and price of whiting by presentation and grade	180
A3.1	Fish landings into the UK by UK vessels 1946-1995	188
A3.2	Number and tonnage of fishing vessels in the UK 1909-1995	193
A3.3	Number of fishermen in the UK 1904-1995	195
A3.4	Imports and exports of fish and fish preparations 1917-1995	197

List of charts

2.1	Main ports (England and Wales) and landing districts (Scotland)	<i>page</i> 6
2.2	Main activity of the UK fishing fleet, by segment, for 1995	8
3.1	Quantity and value of landings by the UK fleet, including the Islands, by department of administration, 1991 - 1995	22
3.2	Landings by UK vessels into the UK	22
3.3	Quantity of demersal landings in the UK by UK vessels	23
3.4	Quantity of cod and haddock landed by the UK fleet, by sea areas in 1995	23
3.5	Quantity of herring and mackerel landed by the UK fleet, by sea areas in 1995	24
3.6	Quantity of crab and nephrops landed by the UK fleet, by sea areas in 1995	25
3.7	ICES fishing areas around the UK coastline	27
4.1	International trade of fish	63
4.2	Quantity of fish available for domestic use in the UK	64
4.3	Quantity of demersal and pelagic fish and fish preparations imported into the UK and exported from the UK in 1995	65
4.4	Average annual price of fish	67
6.1	World marine catch in 1993 by nationality group	103
6.2	World marine catch by ocean, 1970 - 1993	103
6.3	Percentage of the total catch caught in adjacent fishing areas in 1991 - 1993 by the principal countries fishing in non-adjacent areas	104
6.4	Major FAO fishing areas	105
6.5	10m and over fleet of the European Union, by nationality of vessel, as at 31 December 1995	150
A2.1	Quantity of selected species by grade in 1995	156
A2.2	Value of selected species by grade in 1995	157
A2.3	Quantity of selected species by presentation in 1995	158
A2.4	Value of selected species by presentation in 1995	159
A3.1	Quantity of fish available for domestic use in the UK 1965-1985	186
A3.2	UK landings into the UK compared to the number of fishermen	187
A3.3	UK landings into the UK	192

Preface

The UK Sea Fisheries Statistics are intended to provide a broad picture of the United Kingdom fishing industry and its operations. Commentary on some longer term issues appeared in the publication covering 1991 and 1992. A note on the UK sea fisheries statistics methodology appeared in the publication covering 1993.

There are several new elements this year. Appendix 2 shows the quantity, value and price by presentation and grade of selected important species of demersal fish in terms of their actual landed weight. There is also a new table (4.11) in Chapter 4 giving a summary of this data, which will continue to be updated in future publications. Also a few long-running time series have been included in Appendix 3 this year.

We recommend that you refer to the explanatory notes and glossary of terms which are important in interpreting some of the data.

We hope that you will find this publication helpful as a source of information and data about the UK fishing industry. Other useful official publications on sea fisheries statistics are:-

- Scottish Sea Fisheries Statistical Tables;
- The English, Welsh and Northern Irish Fishing Vessel List as at 30 June 1996;
- The Scottish Fishing Fleet at December 1995;
- The Monthly Return for England and Wales; and
- Statistics of Fish Landings in England, Wales and Northern Ireland by Port

More detailed information can be purchased if required. Please write to:

Explanatory notes

1. The tables refer, as far as possible, to the United Kingdom, including the Isle of Man and the Channel Islands, with separate figures for England and Wales, Scotland and Northern Ireland. In some cases figures for the various parts of the United Kingdom are not strictly comparable and differences are explained in the headings and footnotes of the tables.
2. The figures in the tables in Chapter 3 and 4 for catches and landings are given in terms of liveweight, however for Table 4.11 and Appendix 4 data are given in terms of the actual landed weight and for the trade tables where the actual product weights are shown. Data in Table A3.1 are given in terms of equivalent landed weight i.e. head on, gutted for most demersal species.
3. Landings by foreign vessels into the UK include landings by fishing vessels and carriers (if first point of sale of fish). Total imports which combine landings by fishing vessels, carriers and cargo vessels are shown in tables (4.2, 4.4 and 4.6).
4. Mackerel and herring landing figures for 1978 onwards include a quantity caught by British vessels but not actually landing at British ports. These quantities are transshipped to foreign vessels in coastal waters and are later recorded as exports.
5. The following symbols apply throughout:

-	means "nil"
..	means "negligible" (less than half the last digit shown)
nd	means "no data available"
na	means "not applicable"
6. Difficulties in collecting complete statistics on shellfish landings mean that available figures may significantly underestimate the total landings in some instances. The figures are however thought to be broadly indicative of trends.

1 Overview of the UK fishing industry

The UK Fishing Industry

The UK has a major interest in sea fisheries reflecting its geographical position in the North East Atlantic. The fishing industry in the UK has some 9,200 fishing vessels, with a further 550 vessels registered in the Channel Islands and the Isle of Man. In 1995, the UK fleet caught 912 thousand tonnes of sea fish with a total value of £590 million which was landed both into the UK and abroad. There were nearly 20 thousand fishermen involved in sea fishing in the UK and many more involved in the industries which support sea fishing and process and distribute its landings.

Some 791 thousand tonnes of sea fish were landed into the UK by both the UK fleet and foreign fishing vessels with a total value of £522 million. Another major source of supply is the import into the UK in bulk of fish caught by other countries. There is a substantial fish processing industry of around 220 businesses which employ some 19 thousand people. At the retail level, there are three thousand fishmongers employing seven thousand people. An increasing proportion of fish (58 percent) is sold through supermarkets. Fish is also consumed in restaurants and in take away form from fish and chip shops. A small proportion of the catch is used to make fish oils and animal feeds. Some of the species caught by UK fishing vessels are more popular abroad and these species are therefore exported or landed directly abroad. In 1995, UK vessels landed directly into non-UK ports 186 thousand tonnes of sea fish with a value of £112 million.

Administration of the UK Fishing Industry

The UK Fisheries Departments comprise the Ministry of Agriculture, Fisheries and Food (MAFF), the Scottish Office Agriculture, Environment and Fisheries Department (SOAEFD), the Welsh Office Agriculture Department (WOAD), and the Department of Agriculture for Northern Ireland (DANI). Departments in the Isle of Man, Jersey and Guernsey are responsible for administering fishing activity in their respective areas.

The Common Fisheries Policy

The primary aim of the Common Fisheries Policy (CFP) is to ensure rational and sustainable exploitation of fish stocks through conservation and management policies designed to protect resources and reflect the needs of the fishing industry. Structural policies are aimed at improving the balance between catching capacity and available resources by addressing fishing effort. Conservation policies are aimed at regulating the quantities of fish caught, through a system of Total Allowable Catches (TACs) based on scientific advice. These TACs are allocated as quotas to

Member States in accordance with fixed keys based on historic fishing rights. They are complemented by a series of technical conservation measures intended to achieve more selective fishing, for example by setting rules on minimum landing sizes, minimum mesh sizes and gear design, as well as defining areas of seasonal closures, methods of fishing and target species. Opportunities to fish in third country waters are also secured through the CFP.

Producer organisations Producer Organisations (POs) are established under the CFP to enable groups of fishermen to market the fish they catch. In 1985 POs were given the opportunity to manage allocations of some whitefish stocks subject to TAC restrictions in the North Sea (Area IV) and West of Scotland (Area VI). In 1991 this opportunity was extended to TAC whitefish stocks in the English Channel and Western waters (Area VII). In 1995, POs opting for quota management responsibilities were obliged to manage allocations of all Area IV, VI and VII whitefish stocks. Allowing POs to take on this management responsibility enables them to plan their uptake of their particular allocations to optimise the benefit to their members.

Sea Fisheries Committees There are twelve Sea Fisheries Committees (SFCs) which regulate local sea fisheries around virtually the entire coast of England and Wales out to 6 miles. SFCs were established in the last century and are empowered to make bye-laws for the management and conservation of their districts' fisheries. In 1995 their powers were widened to include the control of fisheries in their districts for environmental reasons.

Statistics for Managing Fisheries Prior to 1984, all UK catch statistics were provided to the Fisheries Departments on a voluntary basis. Since that year the regulations of the CFP have required those UK vessels which account for most of the fish caught to provide to the Sea Fisheries Inspectorates of the respective Fisheries Departments, located at the main ports, information on each trip including the main species caught, the area of capture, and the quantities landed. Additional information is collected to complete, as far as possible, the coverage of fishery activity. The combined data provide the main source of catch and landings statistics for UK vessels as recorded in the tables in this publication. (For further information regarding the statistical methodology see Appendix 2 of the 1993 publication).

The catch and landings statistics provide a system for monitoring the uptake of the UK share of stocks for which annual TACs are set. In any year once the quota has been taken the fishery is closed. Only 31 out of 138 species for which catches are recorded are subject to TACs.

Information on the fishing fleet is obtained from the Department of Transport's Register of Shipping and Seamen supplemented by information available to Fisheries Departments.

TABLE 1.1 UK Fishing Industry: Summary Table

£ million (unless otherwise specified)

	1987	1988	1989	1990	1991	1992	1993	1994	1995
(i) GDP for Fishing (a)									
current prices	473	449	423	472	496	486	527	561	590
index (1990 = 100)	131.1	127.0	111.1	100.0	104.6	102.6	110.4	114.1	119.6

Fish as a % of Food	4.6%	4.7%	4.8%	4.8%	4.5%	4.5%	4.7%	4.6%	4.5%
(xiii) Landed Price Index (f)	100.0	96.8	104.2	125.2	127.8	119.5	114.7	118.9	116.0
(xiv) Retail Price Index (g)	102.1	104.2	106.8	118.1	126.1	126.9	125.4	122.8	123.1

- (a) GDP for fishing includes landings abroad from 1990 onwards; 1995 data is provisional
- (b) Year-on-year comparisons may be affected by changes in the industrial classification of some contributors. For most businesses data are appropriate to a single activity heading; where information covers a mixture of activities, the business is classified according to the main activity.
- (c) Prior to 1990 the number of vessels refers to those that were known to be active; after 1990 the number of vessels refers to the registered fleet. The number of vessels excludes those registered in the Channel Islands and Isle of Man. Vessel data for 1990 and subsequent years are under review.
- (d) The quantity of landed fish is expressed in terms of liveweight. The figures for the years 1983 - 1987 relate to landings into the United Kingdom only; whereas those for 1988 onwards relate to landings both into the UK and abroad.
- (e) Imports are valued at cost, including insurance and freight terms whereas exports are valued at free on board terms.
- (f) The landed price index has been calculated on an annual basis with 1987 = 100
- (g) The fish component of the RPI which includes canned and processed fish. The Index is calculated on a monthly basis with January 1987 = 100

2 The structure of the UK fishing industry

Introduction

Prior to 1990, statistics on the UK fishing fleet were based on vessels known by Departments to be active. The basis was changed in 1990 to cover the fleet of fishing vessels as registered with the Department of Transport's Register of Shipping and Seamen. Information provided by the Register includes the length (overall and registered), breadth, gross registered tonnage, power, age and material of construction.

Licensing of vessels first applied in 1977 and covered only fishing vessels over 40 feet (12.14 metres) in certain fisheries. Following the adoption of the European Union's Common Fisheries Policy the UK designated a number of fish stocks as pressure stocks and introduced a restrictive licensing scheme for vessels which fished those stocks. The licensing regime initially only covered vessels over 10 metres *registered* length, but its coverage has been progressively extended over the years. In February 1990 the licensing regime was extended to vessels of over 10 metres *overall* length fishing for TAC stocks. Later the same year restrictive licensing was extended to cover *all fishing* by vessels over 10 metres overall length with the exception of those fishing for salmon and migratory trout which were covered by a separate regime. From May 1993 licensing was extended to vessels of *10 metres overall length and under*.

At each stage, as more information became available, the basis for compiling the statistics on the size of the UK fishing fleet was extended. The figures are not readily comparable from year to year, with the latest figures being the most detailed. Difficulties in the comparability are compounded by the fact that the European Union is progressively altering the methodology used to determine vessel tonnage for the fishing fleet from various national and international standards, previously collectively called GRT, to a common standard based on the International Tonnage Convention 1969 and known as GT. A phased programme of conversion has been introduced and is not due to be completed until 2003.

Whilst vessel tonnage is a volumetric measure, there is no simple mathematical relationship between GRT and GT and for any given vessel establishment of a GT figure can only be done by physical measurement or, in the case of smaller vessels, by the application of formulae designed to give an approximation. GT figures are often higher than GRT figures for the same vessel, the range of outcomes can be as low as 50% or as high as 300% of the original tonnage according to the individual vessel characteristics; for large vessels, GT is almost always higher than GRT.

The registered tonnage figures given in the tables are on a GRT basis for almost all vessels under 27 metres overall length but on a GT basis for a growing number, but still a minority, of vessels 27 metres and over. Year to year movements in the fleet tonnage are therefore affected by an inconsistent basis of measurement.

For administrative and statistical purposes a fishing vessel is attributed to the port and the corresponding Department which issues its licence. In Tables 2.4 and 2.5, 138 vessels were unattributed to any Department; these include vessels which are currently registered but which do not hold a current licence.

Fleet structure and Multi-Annual Guidance Programmes

Under the Multi-Annual Guidance Programmes of the CFP, each Member State's fleet is subdivided into segments. Capacity reduction targets are set for each of these segments and these are tailored to the particular circumstances of each Member State's fleet. In the UK, these segments are currently based on the recorded activity of fishing vessels, with each vessel attributed to a segment on the basis of fishing gears most often used.

The present programme for decommissioning fishing vessels to remove excess capacity from the fleet began in 1993. It was originally planned that this programme should run for three years with a funding of £25 million. An additional £28 million has since been announced and the programme extended to run for five years.

The first two tranches of decommissioning removed 4½ percent of capacity at a cost of £16.6 million. The third tranche removed 2 percent of capacity at a cost of £9.6 million. Some £12 million is available for each of the years 1996/97 and 1997/98.

Table 2.2 gives details of the number of vessels, tonnage and power of the UK fleet in total and by segment at end-1995.

Number of Fishermen

Statistics on the number of fishermen are drawn from surveys carried out by the Sea Fisheries Inspectorates in England, Wales and Northern Ireland and by the Sea Fisheries Protection Agency in Scotland. Overall, the number of fishermen was lower in 1995, though in England and Wales, the numbers of regular fishermen increased whilst that of part-time fell.

Chart 2.1 Main Ports (England and Wales) and Landing Districts (Scotland)

TABLE 2.1 UK Fishing Vessels by Department of Administration

Numbers and Tonnage as at 31 December of each year (a)

	1986	1987	1988	1989	1990	1991	1992	1993	1994	1995
United Kingdom (excluding Islands)										
Number of vessels (b)	8,166	8,204	8,132	8,283	11,189	10,862	10,979	11,108	10,297	9,174
Registered tonnage (c)	116,556	131,312	145,377	137,566	206,587	209,857	211,919	213,667	205,665	206,580
Of which:-										
Over 10m vessels										
England, Wales and Northern Ireland (d)										
Number of vessels	nd	nd	nd	nd	2,534	2,460	2,334	2,128	1,867	1,660
Registered Tonnage	nd	nd	nd	nd	112,066	111,026	109,852	104,887	99,593	100,729
Scotland										
Number of vessels	nd	nd	nd	nd	1,291	1,281	1,269	1,314	1,236	1,195
Registered Tonnage	nd	nd	nd	nd	70,894	75,595	77,446	83,417	82,140	84,451
Under 10m vessels										
Number of vessels	nd	nd	nd	nd	7,364	7,121	7,376	7,666	7,195	6,320
Registered Tonnage	nd	nd	nd	nd	23,627	23,236	24,622	25,363	23,956	21,411
Channel Islands and Isle of Man										
Number of vessels	nd	nd	nd	nd	nd	549	582	584	530	546
Registered Tonnage	nd	nd	nd	nd	nd	4,876	5,334	5,294	4,876	4,869

(a) Prior to 1990 the figures refer to vessels that were active; after 1990 the figures refer to vessels in the registered fleet for which the data are currently under review.

(b) Please note that these figures incorporate changes in the numbers of under 40 feet vessels which are due partly to the changes in the definitions used for this sector of the fleet.

(c) Since fishing vessels can be registered under various Shipping Acts, the registered tonnage figures are not strictly comparable.

(d) The figures for England, Wales and Northern Ireland include vessels not allocated to any department.

TABLE 2.2 Main Activity of the UK Fishing Fleet, by Segment

As at 31 December of each year

	United Kingdom (incl Channel Islands and Isle of Man)					
	Number		Registered Tonnage		Power (kW)	
1994						
Pelagic Gears	68	(1%)	28,588	(14%)	81,908	(7%)

(a) Prior to 1952 figures were based on information supplied by the Registrar General of Shipping and Seamen.

Since 1952 figures have been supplied by the District Fishery Officers of the Ministry of Agriculture, Fisheries and Food

(b) Prior to 1961 Scottish figures were as at 30 November of each year

(c) From 1966 these figures exclude 'hobby' fishermen, ie fishermen who do not fish commercially. The corresponding figures for Scotland and Northern Ireland have never included 'hobby' fishermen.

(d) Includes 1986 figures for Newlyn and Plymouth

(e) No surveys were carried out in England and Wales from 1989 to 1993

(f) The apparent increase in fishermen in Scotland reflected the licensing of 10m & under vessels; when more information became available on the numbers of such active vessels.

(g) As at 31 March for England and Wales in 1994 and 1995

3 Catches and landings data

Summary

In 1995, the UK fleet, including Channel Island and Isle of Man vessels, landed in the UK and abroad 912 thousand tonnes of sea fish (including shellfish) with a value of £590 million. This was the fifth successive year to show an increase in the quantity landed. Within the totals however, there were varying trends.

The steady increase in the total landings by the UK fleet since 1991 continued in 1995, though within the total there were diverse movements. Demersal species represented 42 per cent of the catch by weight in 1995 and 63 per cent of the value of landings by the UK fleet. Pelagic landings have tended to fluctuate from year to year and, though representing 43 per cent of total landings by weight, accounted for just 11 per cent of the total value. Shellfish landings have been on a variable but upwards trend, in 1995 accounting for 14 per cent by weight and 26 per cent by value of total landings by the UK fleet.

Just under four fifths of fish taken by the UK fleet was landed in the UK, the remainder being landed at ports abroad. The proportion of fish landed abroad has nearly doubled since 1989.

In terms of the Department of Administration, Scottish vessels accounted for 70 per cent of the weight and 56 per cent of the total value of landings by the UK fleet. Vessels administered in England and Wales accounted for 27 per cent of the quantity and 39 per cent of the value of the total, whilst Northern Ireland vessels represented about 3 per cent by quantity and 4% by value.

Chart 3.1 Quantity and Value of Landings by the UK Fleet, including the Islands, by Department of Administration, 1991 - 1995.

UK landings into the UK

The total quantity of all fish landed by UK vessels into the UK in 1995 was 726 thousand tonnes, compared with 652 thousand tonnes in 1991. The total value of all fish landed by UK vessels into the UK has been increasing since 1992; in 1995 the total value was £479 million.

Chart 3.2 Landings by UK vessels into the UK

Demersal fish

Cod, haddock, plaice and whiting account for most of the demersal species landed by UK vessels. As can be seen from the Chart 3.3 landings of cod, plaice and whiting declined in the period 1991 to 1992 as the stocks came under increasing fishing pressure, but cod rose again in 1993 to 1995. Landings of haddock increased from 53 thousand tonnes to 93 thousand tonnes in 1994 but then decreased to 85 thousand tonnes in 1995. A more detailed species breakdown of demersal landings in the UK by both UK

and foreign vessels and of landings abroad by the UK fleet can be found in Table 3.3.

Chart 3.3 Quantity of Demersal Landings in the UK by UK Vessels

Chart 3.4 Quantity of Cod and Haddock Landed by the UK Fleet, by Sea Area of Capture in 1995

Of the 79 thousand tonnes of cod landed by the UK fleet in 1995, 51 thousand tonnes were caught in the North Sea (Area IV), 9 thousand tonnes were caught off the Norwegian Coast (Area IIa), 7 thousand tonnes were caught in the Bear Island and Spitzbergen area (Area IIb) and a further 6 thousand tonnes were caught in the West of Scotland area (Area VIa).

Of the 86 thousand tonnes of haddock landed by UK fleet in 1995, 67 thousand tonnes were caught in the North Sea and 11 thousand tonnes were caught in the West of Scotland area.

Pelagic fish

Herring and mackerel are the two main species landed by UK vessels. Landings of herring by the UK fleet declined in the period 1991 to 1994 but rose again in 1995 whereas the quantity of mackerel during the period 1991 to 1993 but then started to decline. The same two species are also the most important in terms of value, annual landings of mackerel were valued at about £37 million, and herring, about £14 million. A more detailed species breakdown of pelagic landings in the UK by both UK and foreign vessels and of landings abroad by the UK fleet can be found in Table 3.3.

Chart 3.5 Quantity of Herring and Mackerel Landed by the UK Fleet, by Sea Areas in 1995

Of the 116 thousand tonnes of herring landed by the UK fleet in 1995, 62 thousand tonnes were caught in the North Sea (Area IV) and a further 46 thousand tonnes were caught in the West of Scotland area (Area VIa).

Of the 219 thousand tonnes of mackerel landed by UK fleet in 1995, 152 thousand tonnes were in the West of Scotland area, 24 thousand tonnes were caught in the English Channel (Area VIId,e) and 22 thousand tonnes in the North Sea.

Shellfish

The two species of shellfish which account for the majority of shellfish landings by the UK fleet are crabs and nephrops. Landings of crabs and nephrops have remained relatively stable at 20 and 29 thousand tonnes respectively. Scallops are also an important species in terms of value. A more detailed species breakdown of shellfish landings in the UK by both UK and foreign vessels and of landings abroad by the UK fleet can be found in Table 3.3.

Chart 3.6 Quantity of Crab and Nephrop Landings by the UK fleet, by Sea Areas in 1995

Of the 24 thousand tonnes of crab landed by the UK fleet in 1995, 9 thousand tonnes were caught in the English Channel (Area VIId/e), 7 thousand tonnes were caught in the West of Scotland area (Area VIa) and a further 6 thousand tonnes were caught in the North Sea (Area IV).

Of the 32 thousand tonnes of nephrops landed by UK fleet in 1995, 13 thousand tonnes were caught in the North Sea, 13 thousand tonnes in the West of Scotland area and 6 thousand tonnes were caught in Irish Sea (Area VIIa).

4 Supplies, Overseas Trade and Marketing

Introduction

This chapter brings together information on fish available for consumption, imports, exports, prices and household consumption. The landings data are given in terms of equivalent live weight but for Table 4.11 which summarises quantities marketed in landed weight. The trade data are shown in terms of actual product weights.

Partial Balance Sheet for the UK

A partial balance sheet for the UK (Table 4.1) has been constructed and included in the Sea Fisheries Statistics publication again this year. Separate tables are given for demersal, pelagic and shellfish, and within these groupings, for particular species.

In aggregate terms, the UK has been a net importer of fish throughout the period 1986 - 1995.

Chart 4.1 International Trade of Fish

Landings by UK vessels into the UK varied during the last ten years between a low of 649 thousand tonnes in 1992 and a peak of 893 thousand tonnes in 1988. More detailed landing data can be found in Chapter 3. Adding net imports and taking into account stock changes gives a figure for the total available for domestic (UK) use. This quantity has varied around a slightly decreasing trend during the period 1985 to 1994.

Most imports of white fish are used by the food industries to produce a variety of fish products for consumption in the home and through the catering industry.

Chart 4.2 Quantity of Fish Available for Domestic Use in the UK

Some 400 thousand tonnes of fish products are manufactured in the UK every year, some 50 thousand tonnes being made into fishmeals, solubles etc. for use as animal feeds.

Approximately 430 thousand tonnes of fish are consumed in the home every year. This includes fried fish bought at the traditional fish and chip shops and taken home to eat. "Other uses" includes human consumption outside the home, e.g. in restaurants.

Imports

The data on imports have been affected by the change in method of recording intra-EU statistics. Figures under the new system for 1993 and 1994 are provisional and appear still to be incomplete by an unknown margin. (For further information on this new system see "Economic Trends" No. 471 January 1993 pages 188 - 190.)

Total imports of fish and fish preparations rose in 1995 by 6 percent to 484 thousand tonnes product weight. In terms of value, total imports rose in 1995 by 11 percent to £1,123 million. As explained above, these figures are provisional; and may understate the amounts actually traded.

Demersal and pelagic fish and fish products account for approximately 85 percent of total imports by weight and approximately 69 percent of total imports by value in 1995. Prepared and preserved fish accounted for 33 percent of total demersal and pelagic fish and fish products imported into the UK by weight in 1995; frozen fillets for 27 percent; other frozen products for 20 percent and fresh, including chilled, for 18 percent. A more detailed breakdown of both quantity and value of imports can be found at Table 4.2.

In 1995 the UK imported 139 thousand tonnes of prepared and preserved demersal and pelagic fish. Of this 87 thousand tonnes were tunny and bonito, plus a further 26 thousand tonnes of salmon. 30 thousand tonnes of prepared and preserved demersal and pelagic fish were imported from the Thailand and 17 thousand tonnes were imported from the U.S.A. Further information on the country of origin of UK imports can be found in Table 4.4.

The UK imported 19 thousand tonnes of fresh and chilled cod, plus 13 thousand tonnes of fresh and chilled haddock in 1995. 146 thousand tonnes of frozen cod fillets were imported in 1995, plus 34 thousand tonnes of frozen cod.

Chart 4.3 Quantity of Demersal and Pelagic Fish and Fish Preparations Imported into the UK and Exported from the UK in 1994

The main type of shellfish imported into the UK in 1995 were shrimps and prawns, of which 28 thousand tonnes were imported in the form of fresh, chilled, frozen or semi-preserved and 30 thousand were imported as preserved or prepared. In total the UK imported 8 thousand tonnes of shellfish and shellfish preparations from Denmark, 12 thousand tonnes from Iceland and 7 thousand tonnes from India in 1995.

Exports

The data on exports have been affected by the change in method of recording intra-EU statistics. Figures under the new system for 1994 and 1995 are provisional and appear to still be incomplete by an unknown margin.

Total exports of fish and fish preparations decreased by 4 percent in 1995 to 359 thousand tonnes product weight. In terms of value, total exports increased by 7 percent in 1995 to £682 million.

Demersal and pelagic fish and fish products accounted for approximately 80% of total exports by weight and approximately 64 percent of total exports by value. Fresh, including chilled fish accounted for 45 percent of total demersal and pelagic fish and fish products exported from the UK by weight in 1995; frozen fillets for 7 percent; other frozen products for 33 percent and prepared and preserved products for 9 percent. A more detailed breakdown of both quantity and value of exports can be found at Table 4.3.

In 1995 the UK exported 104 thousand tonnes of fresh, including chilled demersal and pelagic fish. Of this 40 thousand tonnes were mackerel, 9 thousand tonnes herring, plus a further 22 thousand tonnes salmon. 33 thousand tonnes of fresh, chilled and frozen demersal and pelagic fish were exported to Russia, 65 thousand tonnes to France, 12 thousand tonnes to the Netherlands and 15 thousand tonnes to Spain. Further information on the country of consignment of UK exports can be found in Table 4.5.

The UK exported 22 thousand tonnes of shellfish and shellfish preparations to France and 20 thousand tonnes to Spain in 1995.

Prices

The average annual prices quoted in this publication are based on realisations for first-hand sales of fish to all outlets, i.e. for human consumption and also for other uses such as fish meal and animal feeding stuffs. These prices are calculated using the equivalent live weight.

In 1995 this figure remained virtually unchanged at £659 per tonne. The total demersal price fell slightly (2 percent) in 1995 to £912 per tonne; the price of pelagic fish rose by 1 per cent to £133 per tonne; and the total shellfish price rose by 1 percent to £1,164 per tonne. A more detailed breakdown of these prices for individual species for selected years can be found at Table 4.10.

The graph opposite shows the average annual price of fish in real terms. The current prices shown in Table 4.10 have been deflated using the All Items RPI (1987 = 100).

Chart 4.4 Average Real Annual Price of Fish (Realisations of First-Hand Sales to All Outlets)

The Retail Price of Fish and the Retail Price Index

The Retail Price Index (RPI) measures the rate of change in prices of the goods and services consumed by households. Fish and fish products are included in the representative basket of goods and services for which prices are collected to compile the Index. The representative items are changed to reflect changing consumer tastes. Currently fish is represented in the Index by fresh cod fillets, fresh rainbow trout, frozen plaice fillets, fish fingers, canned tuna, canned salmon and frozen cod (in sauce). The figures used in the UK Sea Fisheries Statistics are the Fish Components of the Index. Further information on the RPI is available in the RPI Business Monitor (MM23). Actual prices of a selection of representative items are also published monthly in the RPI Business Monitor.

(a) Salmon and trout are excluded from the landings data.

(b) Landings are given in terms of landed weight equivalent (i.e. head on, gutted for most species)

(c) Landings include transshipments of mackerel (see explanatory note 2, page viii)

(d) Data on both imports and exports are provisional in 1993 and 1994. They appear to be incomplete by an unknown margin.

(e) The processing figures for 1992 and 1993 are estimates.

(f) Includes fresh fish sold for consumption either directly to consumers or to the catering trade plus wastage

(g) The fish component of the RPI. The Index is calculated on a monthly basis with January 1987 = 100.

* Average values throughout this table are based on realisations for first-hand sales of fish to all outlets, i.e. for human consumption and also for other uses such as fish meal and animal feeding stuffs.

(a) Data for the years 1938 to 1987 were originally calculated on a standard landed weight basis. These data have been converted to a liveweight basis for comparison purposes; however they should not be regarded as showing the accurate liveweight price but may be used to indicate trends

(b) Average values for the UK not available. Landings in Scotland of the species in the years indicated were included with "Other Demersal" or "Other Shellfish".

(c) Prior to 1972 landings of Scallops and Queens were not separately identifiable and were entered under one heading of Scallops.

5 Main Stocks and their Level of Exploitation

UK quotas

Total Allowable Catches (TACs) are set each year by the Council of Ministers following scientific advice on the impact that various levels of fishing will have on the abundance of the stocks. These TACs are then allocated as quotas to member states under the principle of relative stability i.e. in accordance with fixed keys based on historic fishing rights.

Against a background of increasing pressure on stocks and the need to reduce effort, there was nevertheless a modest increase in the overall level of fishing possibilities for UK fishermen in 1995. In particular, the UK benefited from significant increases in West of Scotland haddock and West of Scotland herring quotas.

The UK's fishing opportunities in distant waters remained substantially unchanged from 1994 levels, with only slight reductions in quotas of saithe in Norwegian waters and Greenland halibut in Greenland.

Access to waters under the CFP

At the end of 1994 agreement was reached on revised access arrangements to apply to Community vessels fishing in Western waters from the beginning of 1996. This had the effect of ending the transitional arrangements for those waters which had applied to Spain and Portugal since their accession to the European Union in 1986. Agreement was also reached on the arrangements to apply to Sweden and Finland upon their accession to the Community, along with Austria. Norway decided against accession.

Two regulations were agreed during 1995 setting maximum levels of effort to be deployed by Community vessels fishing in Western waters, and establishing a control and monitoring system in these waters to include a key role for Coastal states.

Main Stocks and their Level of Exploitation

The management of fisheries involves investigations by fishery scientists to assess the impact that fishing has on the stocks, the level of recruitment of juvenile fish and the implications for catch rates. This work is carried out in co-operation with other countries and leads to scientific advice as given by the International Council for the Exploration of the Sea (ICES) Advisory Committee for Fisheries Management (ACFM) on sustainable catch rates. This section gives a brief summary of the position of a number of important stocks. It is based on "No. 295 Report of the I.C.E.S. Advisory Committee on Fishery Management 1995 Parts 1 and 2".

Definitions of the spawning stock biomass (SSB), year class and recruits can be found in the glossary of terms at the back of this booklet.

North Sea

The main demersal stocks harvested for human consumption in the North Sea (cod, haddock, whiting, plaice and sole) were, according to the assessments carried out in 1995, subject to fishing mortality rates in recent years which were amongst the highest in their respective historical series.

The cod stock remains at a very low level, and though recruitment in 1994 was above the long-term average (1963-1994) for the first time in eight years, its SSB in 1995 was just above one half of the level of 150,000 tonnes which is considered by ACFM to be the lowest desirable biological level.

Very poor recruitment to the haddock stock in the late 1980s had resulted in its SSB falling to record low levels in 1990 - 1991. In 1995, however, SSB has risen to around 180 thousand tonnes, well above the lowest desirable biological level, following the recruitment of four more-abundant year classes.

The whiting stock has been adversely affected by 6 consecutive years (1989 - 1994) of below-average recruitment, but fishing mortality has decreased in recent years and its SSB has remained around the recent average of 250,000 tonnes.

The plaice stock was bolstered by above-average recruitment throughout the 1980s, but continuing high levels of exploitation and declining recruitment levels have resulted in its SSB in 1994 falling below the lowest biological acceptable level of 300,000 tonnes, and reaching an historic low in 1995.

Following the recruitment of the exceptionally abundant 1987 year class, the SSB of sole increased considerably in 1990 and, despite continuing high fishing mortality levels, the strong 1991 year class has kept it above the long-term average level in 1995.

Following its recovery from near collapse in the mid 1970s, the SSB of North Sea herring has declined from a peak in 1989 and, by 1995, had fallen below the lowest desirable biological level of 800,000 tonnes. Whilst fishing mortality on the adults has been relatively stable since 1986, exploitation of juveniles has increased in recent years.

English Channel

Recruitment to the sole stocks in the eastern and western English Channel has been generally above average since 1989, and their joint SSB in 1995 remains above the long-term average, at 12,500 tonnes. Though fishing mortality rates have declined in recent years for both these stocks, the western Channel stock is still being exploited at high levels relative to its historical series.

Celtic Sea

Exploitation of the stocks of the two monkfish species increased through the 1980's, but following reduced exploitation and good recruitment during 1990 - 1993, their joint SSB in 1995 has indicated a slow recovery above the historic low of around 60,000 tonnes recorded in 1993.

Irish Sea

The recent very high fishing mortality on cod has declined slightly since 1992, when the SSB was at its lowest level on record, at around 2,900 tonnes. Apart from the above-average 1991 year class, recruitment since 1988 has been below average, and though there has been a small recovery of the SSB, it remains well below its lowest desirable biological level.

Despite a succession of poor year classes since 1986, and a consequent decline in SSB from a peak in 1987, good recruitment in 1990 has resulted in the sole SSB stabilising around its historically lowest level of 3,500 tonnes, which is considered by ACFM to be below the lowest desirable biological level.

West of Scotland

The assessments of demersal stocks in Sub-area VI (West of Scotland and Rockall) continued to be hampered by the poor quality of data upon which the assessments are based. Though fishing mortality rates have declined from the high levels in 1989, and the SSBs in 1995 for all demersal stocks in Division VI have shown a recovery from the low levels recorded in 1991 - 1992, for cod and saithe in particular the SSB in 1995 remains close to or below the lowest desirable biological level. Estimates of recruitment indicated several recent above-average year classes for cod and haddock.

Western Mackerel

The recruitment of several strong year classes up to 1989, and moderate fishing levels, enabled the SSB of mackerel which spawn to the west of the British Isles to increase steadily to over 3 million tonnes in 1991. Since then fishing mortality has increased rapidly, surveys have indicated that only the 1993 year class was above average, and the SSB has declined to below 2 million tonnes in 1995.

6 Overview of the World Fishing Industry

World Catch

Some summary data on the world catch have been extracted from the FAO publication “FAO Yearbook: Fishery Statistics: Catches and Landings 1993” and included in this publication. Tables 6.1 to 6.4 present the annual statistics, for a limited number of years ending in 1993, on a world-wide basis, on **nominal catches** of fish, crustaceans, molluscs and other aquatic animals, taken for all purposes (commercial, industrial and subsistence) except recreational, operating in inshore, offshore and highseas fishing areas (marine fishing areas). Inland waters, both fresh and brackish, are excluded. In view of the difficulty of distinguishing in many cases between recreational and subsistence fishing, figures may include recreational catches.

“**Nominal catches**” refers to the landings converted to a live weight basis. There are many instances where the catches on board fishing vessels or factory ships are gutted, filleted, salted, dried, etc., or reduced to meals, oil, etc. The data on the landings of such species and products require conversion by accurate yield rates (conversion factors) to establish the live weight equivalents at their time of capture.

More detailed information on world catch statistics is available in the “FAO Yearbook: Fishery Statistics - Catches and Landings 1993” publication (ISBN 92-5-003680-9). Information on production, imports and exports of fish and fish products is available in the “FAO Yearbook: Fishery Statistics - Commodities 1993” publication (ISBN 92-5-003681-7).

During the period 1985 to 1993 the world catch figures from marine fishing areas varied between a low of 76 million tonnes in 1985 and a peak of 86 million tonnes in 1989.

The European Union accounted for 8 percent (6.9 million tonnes) of the world marine catch in 1993; Asia for 44 percent (37.0 million tonnes); and Central and South America for 22 percent (18.1 million tonnes).

Vessels from China caught 10.1 million tonnes of fish in 1993; from Peru 8.4 million tonnes; from Japan 8.0 million tonnes; from Chile 6.0 million tonnes; from the USA 5.6 million tonnes; and vessels from the Russian Federation 4.2 million tonnes. These nations between them accounted for half of the world marine catch.

Chart 6.1 World Marine Catch in 1993 by Nationality Group

In 1993, 62 percent of the world marine catch was caught from the Pacific Ocean; 29 percent from the Atlantic Ocean; and 9 percent from the Indian Ocean.

Marine catches from the Pacific Ocean rose during the period 1973 to 1989 from 29 million tonnes to 55 million tonnes; after this they have remained fairly steady. In the Atlantic ocean, marine catches have remained fairly steady during this period, at around 25 million tonnes; whilst in the Indian Ocean, they have been gradually increasing during this period.

Chart 6.2 World Marine Catch by Ocean 1970 - 1993

Table 6.4 shows marine catch by the principal countries fishing in non-adjacent major fishing areas. Non-adjacent fishing areas refer to those major FAO fishing areas (see Chart 6.4) which are not adjacent to a

country's coast. Data for the UK have also been given for comparison purposes.

In 1993, Poland caught 0.9 million tonnes in non-adjacent major fishing areas. This represents 12 percent of its total catch. Spain caught 0.6 million tonnes (47 percent); the Russian Federation caught 0.6 million tonnes (14 percent); the Republic of Korea caught 0.5 million tonnes (20 percent); and Other Asia caught 0.4 million tonnes (33 percent).

Chart 6.3 Percentage of the Total Catch Caught in Adjacent Fishing Areas in 1991 - 1993 by the Principal Countries fishing in Non-Adjacent Areas

EU Quotas and Uptake

Table 6.5 shows the 1994 European Union TACs and quotas (after exchanges etc.), together with the uptake by each Member State. Member States are required to report to the European Commission details of landings into the Member State by both its own vessels and by vessels from other Member States. The figures may therefore differ from those for the UK reported in Chapter 3, which are based solely on reports to the UK.

Appendix 1: Glossary of terms

The various species of fish are divided into three main groups: demersal, pelagic and shellfish. The names of the kinds of fish included in each group are shown in Table 3.3.

The term **demersal** fish covers species living on or near the sea bed.

The term **pelagic** fish covers species found mainly in shoals in midwater or near the surface of the sea.

The **spawning stock biomass (SSB)** is the total weight of a species population capable of reproducing.

A **year class** is the young of any one annual spawning.

Recruits are the young fish in the year class which is entering the fishery.

Fishing capacity is the physical dimension of fishing vessels measured in tonnage, kW or VCU.

Fishing effort is a measure of the fishing activity of vessels based on fishing capacity and the time spent fishing. It may be expressed in tonnage days, kW days etc.

Fishing mortality is the proportion off a stock killed/dying each year as a result of fishing activity.

Fishing areas are defined by international convention. The immediate waters around the UK are subdivided into ICES Sub-areas IV (North Sea), VI (West of Scotland) and VII and its subdivisions (Western approaches, the Irish Sea and the Channel).

A **stock** is that part of a species population exploited in a defined fishing area.

Trawling may be used either for bottom-dwelling (demersal) or mid-water (pelagic) species, the net being of a basic funnel-shaped construction and towed behind a vessel.

Seining is a method used exclusively for demersal fishing. The net, lighter than for trawling, is set on very long ropes designed to herd or contain the

fish for capture. After the fish have been surrounded the net is slowly hauled back to the vessel.

Purse seining is a method used exclusively for pelagic operations. A very large, deep net is shot around a fish shoal and is then closed, or *pursed*, at the bottom to trap the fish. The net is then hauled upwards to concentrate the fish near the surface, and the fish are taken on board using a separate lifting net or pump.

Fixed gears are mainly used for demersal species. They are normally vertically hung curtains of netting, fixed to the seabed with anchors or weights and held upright with floats.

Imports consist of all goods moving into a country, including goods for domestic consumption and goods into bonded warehouses or free zones. In accordance with the internationally recommended practice, import statistics include fish caught by foreign fishing craft, whether or not processed on board, landed in domestic ports.

Exports consist of the outward movement of goods produced by businesses in the UK, plus goods, which after importation, move outward from bonded warehouses or free zones without having been transformed i.e. both exports and re-exports. Export statistics exclude fish caught by domestic fishing craft, whether or not processed on board, landed in foreign ports.

Appendix 2: Quantity, Value and Price by Presentation and Grade

Value of landings and average price data

Sales note information has been routinely provided for landings into Scotland. For landings into England, Wales and Northern Ireland much information is supplied by fishermen, though the amount of detail provided on grade and freshness is less complete. Average prices are derived using the presentation codes of the landings and the average values and quantities landed.

In accordance with EC Regulation No. 103/76, the main commercial fish species must be graded, at first sale on entry to the EU, to the size and freshness standards set out in that Regulation. The three freshness categories are common to all species. In declining order of freshness these are “Extra” or “E”, “A” and finally “B”. Fish in freshness category “Extra” must be free from pressure marks, injuries, blemishes and bad discoloration. Fish in category “A” must be free from blemishes and bad discoloration. A very small proportion with slight pressure marks and superficial injuries shall be tolerated. For freshness category “B”, a very small proportion of fish with more serious pressure marks and slight injuries shall be tolerated. There are separate size categories for each species, usually divided into 4 or 5 categories, with size 1 being the largest category, size 2 the next largest and so on. In Tables A4.1 to A4.5 “other” indicates that no grades are set, for example for frozen fish, or that the grading data is not readily available. The table below shows the current sizes of the species featured in Tables A4.1 to A4.5.

	kg/fish

Appendix 3: Time Series for Selected Fisheries Statistics

History of the publication of Sea Fisheries statistics

Statistics on the fishing industry have been made available by the Ministry of Agriculture, Fisheries and Food since as early as 1912 when the statistical tables and charts were published separately as the “Second Part of the Annual Report on Sea Fisheries” presented by the Fisheries Secretary to Parliament; the data related to England and Wales only.

In March 1921 the Fisheries Secretary (Henry G. Maurice) decided to publish the statistical tables (relating to 1919 and 1920) as a separate volume in advance of the general Report because “the value of the tables is enhanced by early and punctual publication”. At this time they became known as the “Sea Fisheries Statistical Tables”. This continued until the outbreak of the Second World War, when publication of the annual statistics was discontinued.

The “Fisheries in War Time: Report of the Sea Fisheries of England and Wales 1939 - 1944 inclusive” combined the statistical tables with the Annual Report once again as paper shortages rendered it essential to keep the Report as concise as possible: the statistics were however kept as separate as possible by placing them at the back of the report.

The “1945-46 Sea Fisheries Statistical Tables” were again published as a separate publication. This continued until the publication of the “1965 Sea Fisheries Statistical Tables” when for the first time the annual fisheries statistics were presented on a UK basis. This continued up to and including the 1990 publication.

In 1991-92 the publication changed to the present format as “UK Sea Fisheries Statistics”, and included commentary on and graphical presentation of the statistics.

Time Series

Long-running time series have not previously been published by the Ministry in respect of sea fisheries statistics; previously each of the publications has concentrated on the current years statistics, with a few prior years statistics quoted for comparison purposes in the later volumes.

A number of time-series are being included in this volume drawing on the previously published annual statistics.

Fish Landings into the UK by UK vessels

Landings of fish into the UK by UK vessels was published in terms of their standard landed weight equivalent in the “Sea Fisheries Statistical Tables” for the years 1965 to 1990. When the first of the “UK Sea Fisheries Statistics” volumes were published, covering the period 1991 and 1992, the data was expressed in liveweight to be comparable that used for TACs and quotas and the standard international statistical publications (e.g. that published by the FAO).

Table A3.1 gives a time-series showing the landings of fish into the UK by UK vessels in terms of the standard landed weight. Quantities of whole, headless or filleted-at-sea fish landed are shown in terms of equivalent landed weight for the most common form of presentation (head on, gutted for most species).

As can be seen from Chart A3.3 the quantity of landings fell during the 1980’s but have been increasing slightly during this decade.

Chart A3.1 Quantity of Fish Available for Domestic Use in the UK 1965-1985

An approximate series on the total quantity of fish available for domestic use can be calculated from the landings by UK vessels into the UK plus net imports (i.e. imports - exports). Chart A3.1 shows these series during the period 1965 to 1995; the total available for domestic use has been declining during the 1970’s and 1980’s and has then been increasing again during the 1990’s.

Chart 3.2 UK Landings into the UK Compared to the Number of Fishermen

Chart 3.2 shows the number of fishermen in the UK compared to the quantity of landings. Both series are showing a long-term gradual decline over the majority of this period.

TABLE A3.1 Fish Landings into the UK by UK Vessels

(standard landed weight)							
	Demersal & Pelagic Fish		Shellfish		Total All Fish

(a) Values at constant prices are the current price values deflated by the All Items Retail Price Index (1995 = 100)

(b) From 1988 data on landings has been published in liveweight equivalent; the data is therefore only available at total UK levels

(c) Landings into Northern Ireland are generally unavailable prior to 1956

(d) Data on the quantity of shellfish landed into Northern Ireland during the period 1956-1961 is generally unavailable
