oecologie der dieren,  
zoogeografie en  
natuurbehoud

## 1. INLEIDING

In opdracht van de Dienst Getijdenwateren (DGW) van Rijkswaterstaat werd in het broedseizoen van 1991 een veld-ecologisch en toxicologisch laboratoriumonderzoek aan de Visdief (*Sterna hirundo*) uitgevoerd.

In het veld-ecologisch onderzoek zullen broedbiologische waarnemingen in Visdiefkolonies foeragerend op Nederlandse kust- en binnenwateren met verschillende contaminatie-niveaus uitgebreid vergeleken worden met laboratoriummetingen van een aantal PAK's.

Hieronder volgt een analyse van een aantal parameters van het broedbiologisch onderzoek van iedere kolonie (Terneuzen, Verdronken land van Saeftinghe en Zeebrugge). In de bijlage bevinden zich de files waarin alle basisgegevens vervat zijn.

## 2. MATERIAAL EN METHODEN

### A/ INVOER VAN DE GEGEVENS

De invoer van de gegevens gebeurde in het spreadsheetprogramma LOTUS en dit per kolonie. Hieronder volgt de bespreking van de werkwijze gevuld bij deze invoer.

#### a. NESTCONTROLES

\*\*\* veldgegevens:

kolom 1: nestnummer (NNR)

kolom 2: einummer (ENR)

kolom 3-n: controlegegevens

codes bv:

1 ei aanwezig

0 ei afwezig

P pullus

de datum van de controle staat in de eerste rij als een soort titel van de tabel. De relevante datums worden daarna nog als kolom opgenomen (zie verder).

kolom n+1: lengte ei (EIL)

kolom n+2: breedte ei (EIB)

kolom n+3: ringnummer (RNR) (enkel indien het van een individueel ei bekend is)

kolom n+4: ei/RNR ; code 1 indien geweten is van welk ei de pullus afkomstig is. Code 0 indien dat niet het geval is.

\*\*\*bij te voegen gegevens afkomstig van de veldgegevens:

kolom i en ii: reden van het al of niet kapot gaan van het ei. Verschillende codes bedenken.

0 niets te zien aan het ei

1 bluts

2 gebarsten door onkende reden

3 gebarsten door aktiviteiten onderzoekers

4 ei kapot gemaakt door en verwijderd door onderzoekers

5 ei gewoonweg verdwenen reden onbekend  
6 ei aangepikt door onbekende (predatie)  
7 eieren vertrappeld door jongen  
8 ei niet uitgekomen  
9 ei weggespoeld  
10 ei ver(huisd)plaatst  
11 ei kippend dood  
12 nest verlaten  
13 naar lab Utrecht  
14 ondergestoven  
15 nest verdwenen  
.....

Kolom iii: het lot van het jong (bv. direct na uitkomst gestorven, op latere leeftijd dood gevonden, niet meer gezien)

- 1 dood na uitkomen (binnen de eerste drie dagen)
- 2 dood na meer dan 3 dagen
- 3 dood tengevolge het onderzoek

Kolom iv: weergeven van misvormingen, kwetsures, ziekte, ...

- 0 geen
- 1 pootmisvorming
- 2 bekmissvorming
- 3 lichaamsgezwel
- 4 vleugelmisvorming
- 5 gekwetste bek
- 6 wonde
- 7 ziek
- 8 kale plek
- 9 gezwollen oog
- 10 geklemde ring

kolom v: datum waarop het ei voor het eerst werd waargenomen (DATEI)

kolom vi: datum eileg (exacte datum) (DATLEG)

kolom vii: datum waarop het jong voor het eerst werd waargenomen (DATPUL)

kolom viii: exacte datum van uitkomen (DATUIT)

kolom ix: periode eileg (PERLEG)

kolom x: periode uitkomen (PERUIT)

kolom xi: legduur (LED) = duur tussen 1ste en 2de, tussen 2de en 2de en 3de ei en de som van beide. Gezien niet altijd elke dag gecontroleerd is kan een best professional judgement hier nodig zijn! (voor het eerste ei wordt de legduur automatisch op nul gezet)

Kolom xii: broedduur (BRD) = duur van verschijnen ei tot uitkomen.

kolom xiii: uitkomstsucces (UKS): 1 indien het ei uitkwam, 0 indien niet.

Opmerkingen:

1) de datums werden ingevoerd als gewone datum (bv: 15 05 91). Voor de kolommen DATLEG, DATUIT, PERLEG en PERUIT werd deze datum omgezet in een getal dat het aantal dagen na 1 januari 1991 weergeeft.

2) van de nesten die slechts halverwege de rit zijn opgenomen is nog legdatum (legdatum 0) nog eivolgorde bekend. De einummers worden dan ingevoerd als 5,6,7 en 8. Voor deze legsels is er uiteraard nog een legduur (?) nog een broedduur (?) gekend.

3) indien de exacte leg- of uitkomstdatum niet gekend was werd een gemiddelde datum berekend (=gemiddelde dag tussen twee opeenvolgende controles). Deze datums vindt men terug in de kolommen PERLEG en PERUIT.

#### b. METINGEN JONGEN

veldgegevens:

- datum (van meting) (DAT)
- ringnummer (RNR)
- maat 1 Kop-snavel lengte (KSL)
- maat 2 Gewicht (GEW)
- maat 3 Vleugel lengte (VLL)

Deze gegevens werden allemaal één na één ingevoerd (alles door elkaar). Daarna werd de file gesorteerd op ringnummer en datum, en werden de volgende gegevens bijgevoegd: nestnummer, einummer, uitkomstdatum, ei/RNR.

Met deze file wordt dan de leeftijd (DAT - DATUIT) berekend van het jong op de meetdatum. Dit kan dan gebruikt worden voor grafieken etc.

#### c. VOEDSELGEVEGENS

kolom 1: Datum

kolom 2: uurklasse (10 = tussen 10 en 11 uur etc.)

kolom 3: nestnummer

kolom 4: omstandigheid

- 1 balts
- 2 partner op nest voederen
- 3 jong voeren
- 4 eigen consumptie (onafhankelijk periode)
- 5 prooi geweigerd door adult
- 6 " " " jong
- 7 overvliegend met voedsel
- 8 uitgebraakt door jong

kolom 5: prooisoort; gebruikte afkortingen:

onbekend (ob), haring (cl), platvis (pv), kabeljauw (kj), krab (kb), zeenaald (zn), spiering (sp), grondel (gd), garnaal (ga), stekelbaars (sb), paling (pa), zeenaald (zn).

kolom 6: afmeting in aantal maal beklengte

#### d. STRUCTUUR KOLONIE

De nesten van de kolonie te Terneuzen en Saeftinghe werden ingemeten met een teodoliet. De kolonie van Zeebrugge werd opgetekend aan de hand van een op het veld geplaatst raster.

Enkel de gegevens van Terneuzen en Saeftinghe werden in de

bijlage opgenomen.

## B/ VERWERKING VAN DE GEGEVENS

De lotusfile van de nestcontroles dient primair als invoer en overzicht van de gegevens. Van deze file werd een 'spssfile' gemaakt door het weglaten van de nestcontroles en de kolommen DATEI en DATPUL. Hierna werd deze file in SPSS ingelezen om verder te verwerken.

Als voorbeeld werden van iedere kolonie een aantal parameters berekend. Hiertoe werd een spss log-file geschreven:

```
TRANSLATE FROM 'd:spsstern.wk1' /TYPE WK1 /FIELDNAMES.

```

De resultaten hiervan vindt men terug onder de paragraaf "resultaten".

### 3. RESULTATEN

clutch: aantal (frequentie) 1, 2, 3 en 4 legsels.  
 laydate: legdatum van het eerste ei  
 brd3: gemiddelde broedduur per nest  
 klaydate: klassen van laydate (vroege, piek en staartbroeders)  
 laytime: legduur per nest  
 succes: uitkomstsucces per nest  
 eivol, eil, an eib: eivolume, eilengte en eibreedte.  
 keivol: klassen van het eivolume  
 uks: uitkomstsucces per ei  
 brd: broedduur per ei
