1. INTRODUCTION

IMDC NV was asked by the “Afdeling Maritieme Toegang van de Vlaamse Overheid” to provide maps of the flow conditions in the Scheldt River for the surroundings of the Deurganckdok, such as were obtained by IMDC during various through tide measurement campaigns. This document presents these maps for various through tide measurements from June 2008 to March 2009.

In the following, first the measurement campaigns are described. This is followed by an overview of the techniques that were used for the processing of these data. Finally, the data from through tide measurements at eight different measurement dates are presented.

2. OVERVIEW OF THE MEASUREMENTS

In this report, measurements are reported from three different transects at nine different measurement dates between 2008 to 2009. All current measurements presented here were performed with an Acoustic Doppler Current profiler (ADCP) attached to a measurement vessel. The processing of these current profiles in order to obtain the flow maps is presented in chapter 3. At each measurement day, a measurement of the flow in a transect was started every 15 minutes. The measurements are summarized in Table 2-1. A map of the different transects is given in Figure 2-1

More information on these measurements can be found in IMDC (2008u, 2008v, 2008x, 2009a, 2009e, 2009f, 2009 I, 2009n, 2008y).

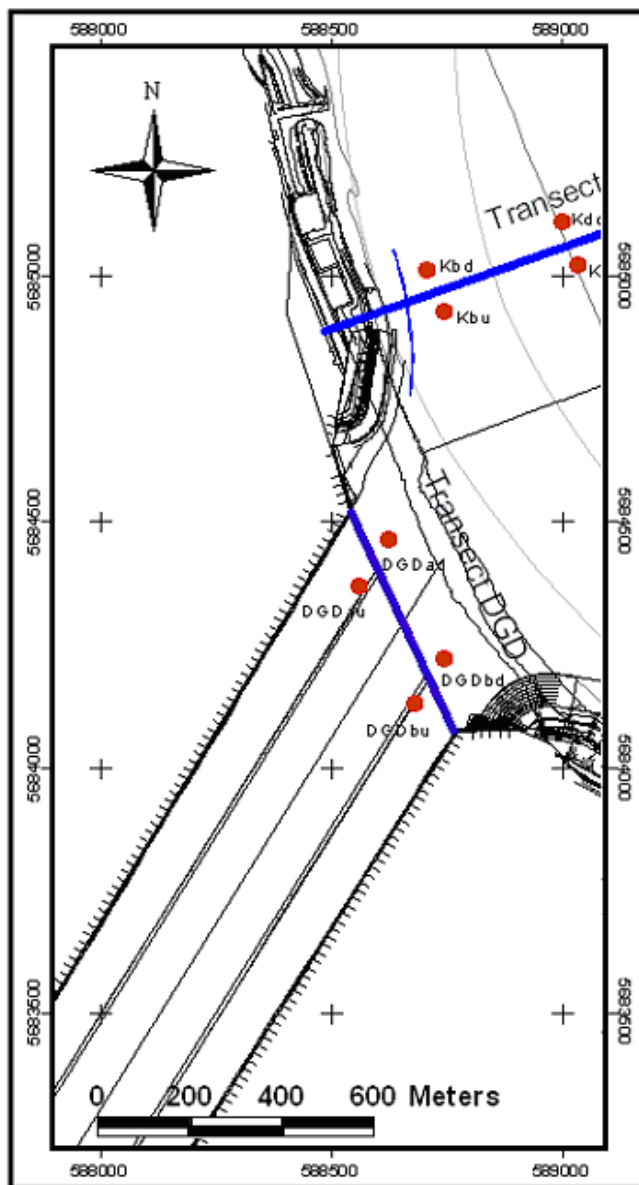

Figure 2-1: Map of sailed transect and calibration points for all measurements except October 1st 2008.

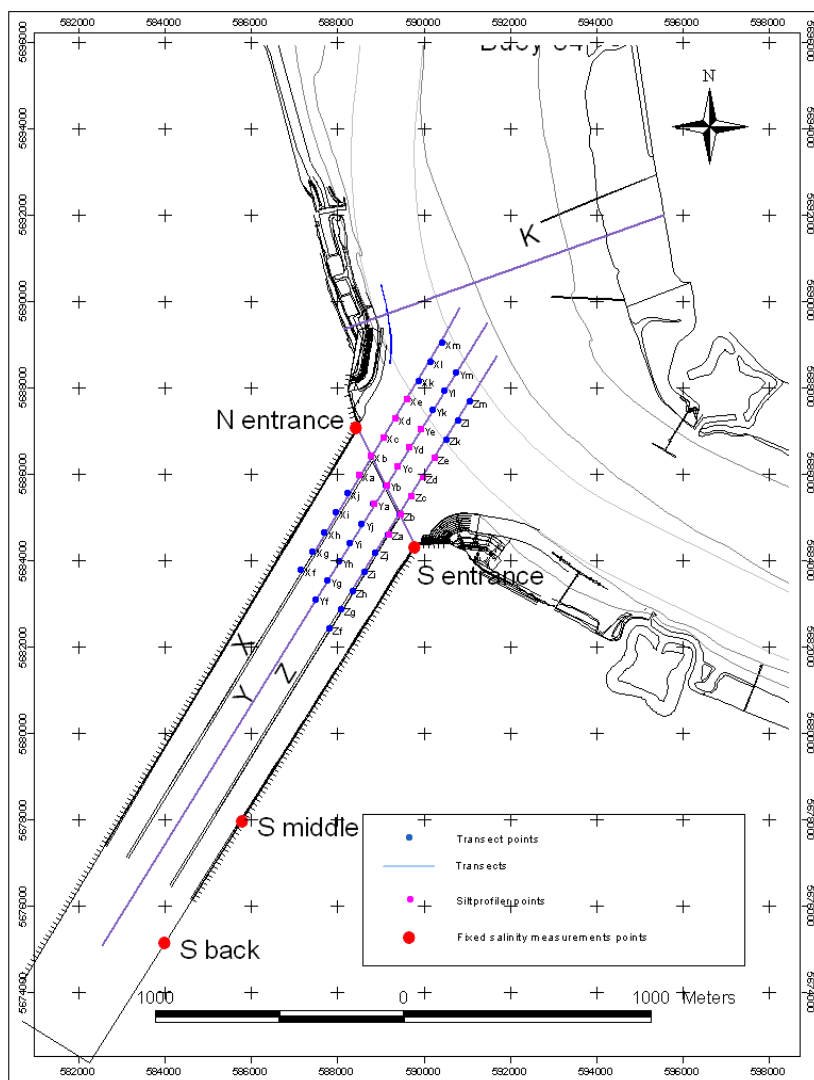

Figure 2-2 Map of sailed transect and calibration points for measurements on October 1st 2008.

Table 2-1 Overview of the measurements.

Date	Transect	ship	tidal coefficient	Reference
19-6-2008	DGD	Scheldewacht	1.00 – 1.03	IMDC (2008u)
26-6-2008	DGD	Scheldewacht	0.92 – 1.01	IMDC (2008v)
24-9-2008	DGD	Scheldewacht	0.74 – 0.88	IMDC (2008x)
30-9-2008	DGD	Scheldewacht	1.05 – 1.11	IMDC (2009a)
1-10-2008	DGD x	Scheldewacht	1.07 – 1.11	IMDC (2008y)
1-10-2008	DGD y	Scheldewacht	1.07 – 1.11	IMDC (2008y)
1-10-2008	DGD z	Scheldewacht	1.07 – 1.11	IMDC (2008y)
2-12-2008	DGD	Scheldewacht	0.97 – 0.99	IMDC (2009e)
10-12-2008	DGD	Scheldewacht	0.95 – 1.00	IMDC (2009f)
6-3-2009	DGD	Parel II	0.80 – 0.83	IMDC (2009i)
12-3-2009	DGD	Parel II	1.21 – 1.28	IMDC (2009n)

3. PROCESSING OF DATASETS

3.1. Methodology of processing of the ADCP data

The recorded velocity fields of the ADCP data were used to obtain maps showing the velocity fields of all transects that were measured together. In the following, first the used depth averaging methodology is discussed, then the maps containing the depth averaged velocity fields and the presented output.

3.1.1. Depth averaging methodology

Because of the importance of the flow for navigation purposes, a depth-averaging methodology was used here, which explicitly accounts for the effect of the flow on the vessels.

In this technique, the measured velocity is averaged by summing the flow pressure (calculated from the measured velocity) on a strip of unit width on the vessel, and then calculating an equivalent velocity from this pressure. For the average direction, the direction of the sum of the squared velocities is taken, and hence this equivalent velocity is a kind of root mean square.

The two horizontal components of the force on a vessel per unit width (F_x and F_y) with a draught H are given by:

$$F_x = C \int_H \rho u_x U dz$$

$$F_y = C \int_H \rho u_y U dz$$

Here, u_x and u_y are the velocities in the x and y direction respectively, U is the velocity magnitude and C is a dimensionless constant. The total force on the vessel is given by:

$$F = \sqrt{F_x^2 + F_y^2}$$

Now, the total force on the vessel is represented by an equivalent velocity U_{eq} and direction ϕ_{eq} :

$$F \equiv C \rho H U_{eq}^2$$

This leads to:

$$U_{eq}^2 = \frac{F}{C \rho H} = \frac{C \sqrt{\left(\int_H \rho u_x U dz \right)^2 + \left(\int_H \rho u_y U dz \right)^2}}{C \rho H}$$

which leads for the assumed constant density to:

$$U_{eq} = \left(\frac{\left(\int_H u_x U dz \right)^2 + \left(\int_H u_y U dz \right)^2}{H^2} \right)^{1/4}$$

and

$$\phi_{eq} = \arctan\left(\frac{F_y}{F_x}\right) = \arctan\left(\frac{\left(\frac{C \int \rho u_y U dz}{H}\right)}{\left(\frac{C \int \rho u_x U dz}{H}\right)}\right) = \arctan\left(\frac{\left(\frac{\int u_y U dz}{H}\right)}{\left(\frac{\int u_x U dz}{H}\right)}\right)$$

3.1.2. Maps of the measured depth averaged velocity

Maps were made of the measured depth averaged (over the highest 4 and 12 m of the water column) velocity fields by plotting a velocity vector at the recorded location of the measurements (using ED 50 UTM 31 coordinates), together with a map of the Deurganckdok and the Scheldt river. These maps are presented in Annex A to Annex I.

3.1.3. Output

In Annex A to Annex I, the measured depth averaged velocities (over the highest 4 and 12 m of the water column) are plotted. Here the depth-averaged velocities were calculated with the methodology described in the previous paragraph. For the area between the highest measurement bin and the free surface, the velocity data were extrapolated for each ensemble assuming a constant velocity equal to the velocity in the highest measurement bin of that ensemble. In the horizontal plane, an averaging over five vectors along the transect was performed, and only these averaged vectors (i.e. one out of five) were plotted, because otherwise the vectors would be too closely spaced to obtain a clear view. Each map shows the velocity fields of all simultaneously measured data. The tidal data presented in these graphs are those from Liefkenshoek. However, the time of the measurement with respect to the moment of high water is given for the High water at Prosperpolder (with is also used in the tide booklet). These times were rounded to 10 minutes for easier readability. In each graph, the tidal coefficient (defined as the measured water level amplitude, divided by the 10 year average amplitude) is also given.
