## 1. INLEIDING

### 1.1. De opdracht

Deze studie betreft het uitvoeren van een meetcampagne in het kader van de aanslibbingsproblematiek in de haven en jachthavens van Nieuwpoort. Langdurige metingen en 13-uursmetingen van de hydraulica en het sedimenttransport werden uitgevoerd in de haven van Nieuwpoort in opdracht van de Administratie Waterwegen en Zeewezen, Afdeling Waterbouwkundig Laboratorium en Hydrologisch Onderzoek' (16EB/04/19). Deze studie werd toegekend aan Gems International in samenwerking met International Marine and Dredging Consultants NV.

### 1.2. Doel van deze studie

Het doel van de studie is om de huidige toestand in de haven en jachthavens van Nieuwpoort goed te begrijpen door in de eerste plaats kennis te vergaren van de huidige stromingspatronen aan de hand van snelheidsgegevens, saliniteits- en sedimentconcentratie metingen. Enerzijds dienen deze metingen om inzicht te verwerven in de aanslibbingmechanismen en anderzijds ter calibratie en validatie van fysische en numerieke modellen.

### 1.3. Overzicht van de studie

Dit rapport maakt deel uit van het geheel van rapporten dat de resultaten van de meetcampagne beschrijft;

- Rapport 1 : Langdurige CTD, turbiditeit en stroommetingen d.d. juli 2005 t.e.m. januari 2006 te Nieuwpoort (I/RA/11277/06.017/BQU)
- Rapport 2: Dertienuurs ADCP-snelheidsmeetcampagne d.d. 6 oktober 2005 te Nieuwpoort (I/RA/11277/06.018/BQU)
- Rapport 3: Aanvullende dertienuurs drijvermeetcampagne d.d. 21 november 2005 te Nieuwpoort (I/RA/11277/06.019/BQU)
- Rapport 4: Aanvullende sedimentconcentratie metingen d.d. 6 oktober 2005 te Nieuwpoort (I/RA/11277/06.020/BQU)

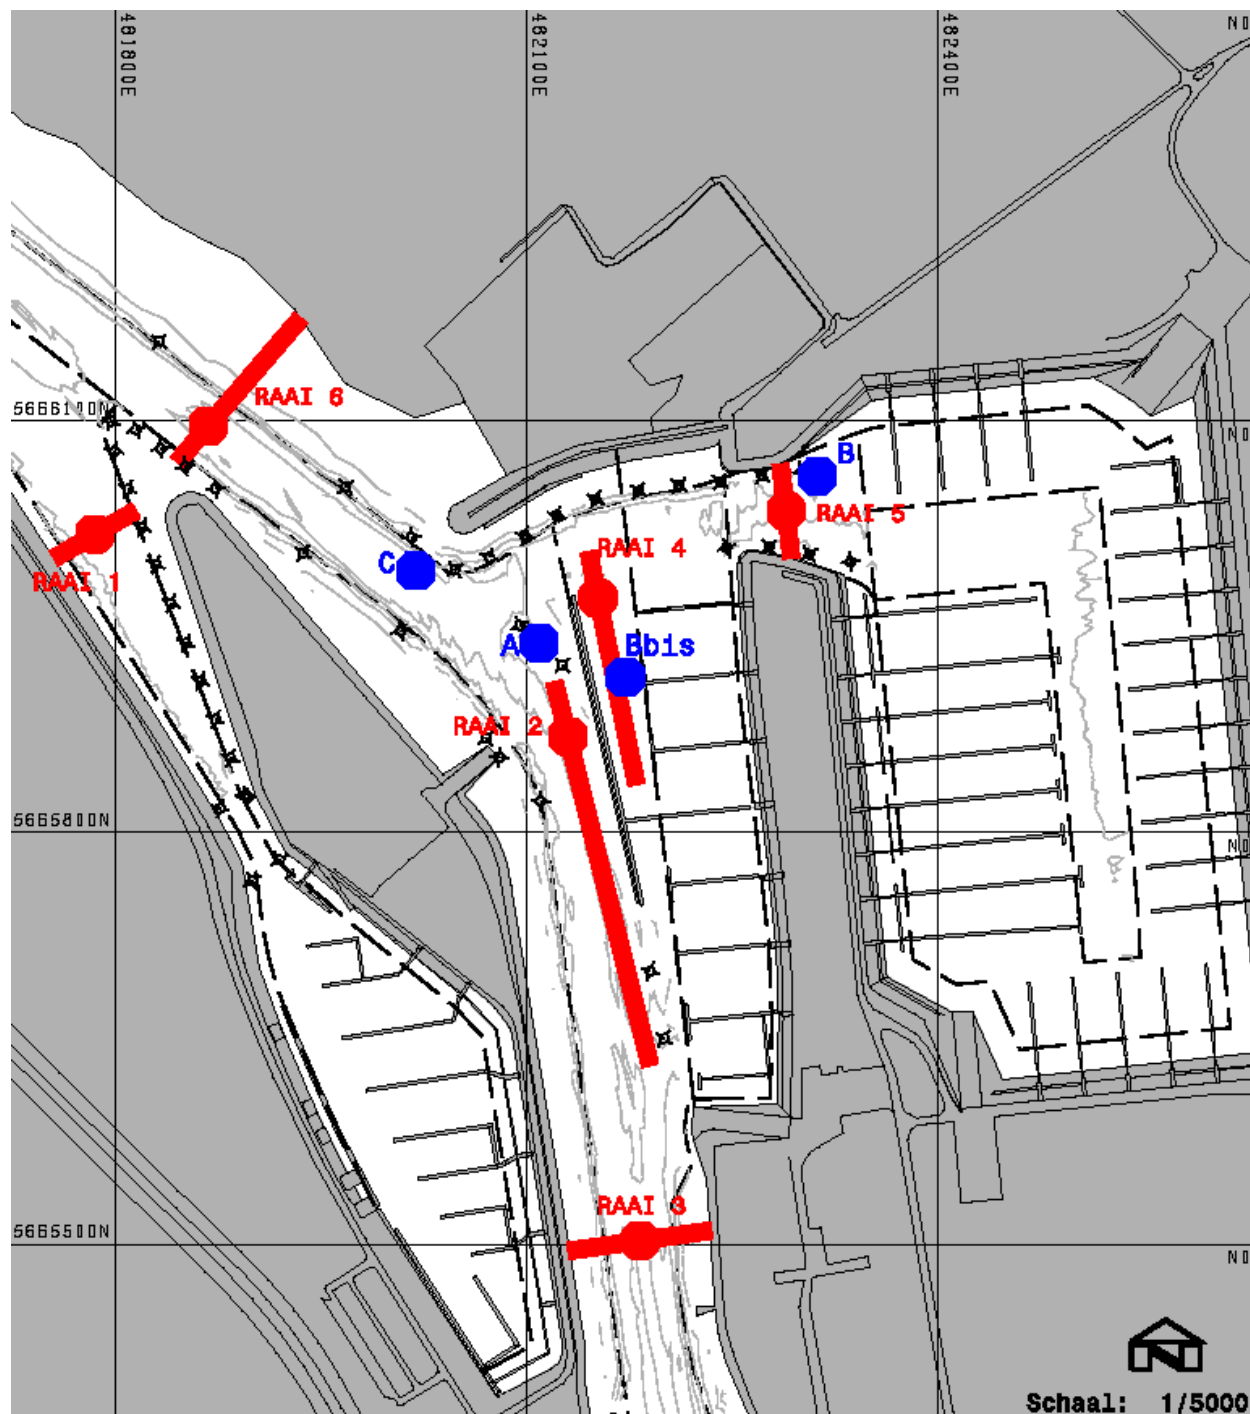

### 1.4. Structuur van het rapport

Dit document bevat de rapportage van de dertienuurs-snelheidsmeetcampagne die werd uitgevoerd op 6 oktober 2005 in de haven en jachthavens van Nieuwpoort. Het eerste hoofdstuk bestaat uit de inleiding, het tweede hoofdstuk omschrijft de meetcampagne. De verwerking van de meetdata en de resultaten van de snelheidsmetingen zijn terug te vinden in hoofdstuk 3.

## 2. DE MEETCAMPAGNE

### 2.1. Beschrijving van de 13uurs-snelheidsmeetcampagne

Het doel van deze metingen was om de snelheids- en sedimentconcentratiedistributie en de sedimentflux te kennen.

Figuur 2-1: Meetlocaties gedurende 13uurs-campagne thv vaargeul en jachthavens

Figuur 2-2 : Meetlocaties gedurende 13uurs-campagne thv Lange Brug

### 2.1.1. Mobile stroomsnelheidskampagne

Stroomsnelheid, stroomrichting, turbiditeit, saliniteit en temperatuur werden gemeten op 6 oktober 2005 vanaf 9u44 MET tem 23u30 MET.

Vanop het meetvaartuig GeoXYZ werd er gedurende een volledige getijcyclus (van Laagwater naar Laagwater) een vast parcours gevaren, waarin 6 vaste raaien werden bevaren (de cyclus startte telkens bij raai 1 en eindigend bij raai 6). Dit parcours werd in totaal 15 keer gevaren (15 meetcyclussen). Deze raaien zijn in het rood aangeduid op Figuur 2-1.

Het meetvaartuig GeoXYZ was uitgerust met een RDI Acoustic Doppler Current Profiler 600KHZ. Per gevaren raai werd er telkens 1 waterstaal genomen en tegelijkertijd werd 1 verticaal CTD-turbiditeits profiel opgemeten ter calibratie van de ADCP raaien in het verwerkingsprogramma

Sediview. De locaties waar deze waterstalen en profielen werden genomen zijn a.d.h.v. rode stippen weergegeven op Figuur 2-1. Aangezien er 15 meetcyclussen gevaren zijn met telkens 6 raaien zijn er in het totaal 90 waterstalen en profielen genomen volgens de hieronder beschreven procedure.

Per meetpunt werd samen met een OBS5 (CTD & Turbiditeitsgegevens) een dompelpompje langzaam tot op de bodem gezakt en vervolgens terug opgehaald tot op de diepte waar het waterstaal diende genomen te worden. Op deze diepte werden beide toestellen een halve minuut ter plaatse gehouden, waarna aan boord een recipiënt van 1 liter werd gevuld. De diepte waar het waterstaal werd genomen wisselde per raai af tussen diep (ongeveer 2 meter boven de bodem), ondiep (ongeveer 2 meter onder het wateroppervlak) en in ongeveer het midden van de waterkolom, om zo een goede spreiding te hebben van de kalibratiestalen.

tabel 2-1 en tabel 2-2 geven de theoretische coördinaten weer van de gevaren raaien en de genomen calibratiepunten. (L: linkeroever, R: rechteroever, N: Noord, Z: Zuid)

tabel 2-1 Theoretische coördinaten van de gevaren raaien

### 2.1.2. Stationaire stroomsnelheidscampagne

Naast deze mobiele ADCP metingen vanop de boot, werden op 4 vaste plaatsen vanop de bodem met uploeking Nortek Doppler Profilers data gelogd. De meetlocaties (A t.e.m. D) werden

aangeduid a.d.h.v. blauwe stippen op Figuur 2-1 Figuur 2-2, terwijl het overzicht van deze metingen is weergegeven in tabel 2-3.

Deze meetinstrumenten hebben gelogd van 05/10/2005 12u00 t.e.m. 07/10/2005 19u30 (MET) gedurende 3 volledige getijcycli, waar de getijcyclus van de mobiele 13-uurssnelheidscampagne in omvat zit.

Op vraag van de aanbestedende overheid werden op meetlocatie Bbis (Figuur 2-2) extra metingen uitgevoerd na de 13uurs-meetcampagne om een beeld te krijgen van de invloed die de stormmuur heeft op de stroompatronen.

## 2.2. Beschrijving van de meetopstelling & meetapparatuur

### 2.2.1. ADCP

De mobiele stroommetingen werden uitgevoerd met een RDI ADCP 600kHz Workhorse Rio Grande. Voor positionering werd gebruik gemaakt van een Trimble DGPS Flepos-inbelsysteem.

Dit Doppler Profiler meettoestel werd downlooking gemonteerd op een aluminium paal op de neus van het schip (zie Figuur 2-3). Fluxgate compass en tilt sensor (intern in de ADCP) werden gebruikt om de metingen te compenseren. De GPS-antenne werd eveneens op de neus van het schip geplaatst.

*Figuur 2-3: ADCP gemonteerd op kantelbare aluminium paal op de neus van het meetschip "GeoXYZ"*

De instellingen van de ADCP 600KHz staan in tabel 2-4.

*tabel 2-4 Instellingen van RDI ADCP 600kHz Workhorse*

Transducer diepte : 0.85 m
Blanking distance: 0.25m
Celgrootte: 0.5 m
Aantal gelogde cellen: 28
Aantal Water Pings per ensemble: 5
Aantal Bottom Track pings per ensemble: 2
Tijd tussen ensembles: 0
Averaging: None
3-beam oplossing: Actief

De acquisitie software Winriver werd gebruikt om de data binnen te lezen en te loggen. Technische gegevens over de RDI ADCP 600kHz staan in APPENDIX A.

### 2.2.2. OBS5

Gedurende de mobiele 13uurs-stroomsnelheidsmeetcampagne werden aan boord met het OBS5 meetinstrument verticale turbiditeitsprofielen gemeten in de waterkolom van wateroppervlak tot bodem (meetlocaties aangeduid met rode stippen op Figuur 2-1).

*Figuur 2-4 OBS5 wordt neergelaten tijdens mobiele 13uurs-meetcampagne op meetschip "GeoXYZ"*

De D&A Instruments OBS5 is een direct reading optical backscatter met een geïntegreerde druk-, temperatuur- en conductiviteitsensor.

Het toestel werd zo ingesteld dat iedere seconde een datastring werd uitgestuurd met gegevens van druk, conductiviteit, en turbiditeit. De metingen werden ingelezen met de Turbiwedge acquisitiesoftware (datum en tijd werd hierin gekoppeld aan de data).

In APPENDIX A staan de technische gegevens van D&A Instruments OBS5.

### 2.2.3. Waterpomp

Gedurende de mobiele 13uurs-meetcampagne werd een waterpompje samen met de OBS5 neergelaten. De zuigmond van dit waterpompje werd op dezelfde hoogte gehangen als de turbiditeitsensor van de OBS5 (aangeduid met gele pijl op Figuur 2-4).

Waterstalen werden genomen in 1 liter flessen (zie Figuur 2-5). De opzuigsnelheid van het pompje werd vooraf uitgetest adhv gekleurd vloeistof. Hierbij werd de tijd tussen het opzuigen van het water (aan de zuigmond) en het vullen van de fles (aan de uitgang) genoteerd. Deze bedroeg 30 seconden. Hiermee werd rekening gehouden bij het nemen van de waterstalen tijdens de meetcampagne.

Ter controle werden een aantal watergrabs genomen op dezelfde plaats en tijd om een eventuele verschil te kennen bij het “opzuigen” en “nemen” van een waterstaal.

*Figuur 2-5 Waterstaalname tijdens mobiele 13uurs-meetcampagne op meetschip “GeoXYZ”*

### 2.2.4. Nortek Acoustic Doppler Profilers

Deze meetinstrumenten meten adhv de Doppler technologie de stroming over de gehele waterkolom. Per cel worden de stroomsnelheidscomponenten en de resulterende stroomsnelheid en -richting gelogd. Deze gegevens zijn een gemiddelde van metingen binnen een bepaalde periode (average interval) en worden gelogd volgens het ingesteld profielinterval.

#### 2.2.4.1. Nortek Aquadopp Profiler

Op de meest ondiepe meetlocaties (locaties A, B en Bbis) werden Nortek Aquadopp Profilers 2.0MHz ingezet. Deze werden stationair in een frame op de bodem geplaatst.

Figuur 2-6 Meetopstelling Aquadopp Profilers 2.0.MHz (links: opstelling locatie B & Bbis / rechts: locatie A)

De gebruikte instellingen voor de verschillende locaties staan in tabel 2-5:

tabel 2-5 Instellingen van Aquadopp Profilers op meetlocaties A, B en Bbis

Locatie	Profielinterval [sec]	Average interval [sec]	Transducer boven bodem [m]	Blanking Distance [m]	Celgrootte [m]	Aantal cellen
A	60	30	0.59	0.1	0.2	50
B	60	30	0.63	0.1	0.2	50
Bbis	60	30	0.63	0.1	0.2	50

In APPENDIX A staan de technische gegevens van Nortek Aquadopp Profiler.

#### 2.2.4.2. Nortek Acoustic Doppler Profiler (ADP)

Op meetlocatie C ("vaargeul") werd een ADP geplaatst met frequentie van 1.5MHz. Die werd stationair in een frame op de bodem geplaatst. Er werd een externe batterij voorzien.

tabel 2-6 Instellingen van de stationaire Nortek Doppler Profiler op meetlocatie C

<b>Locatie</b>	<b>Profielinterval [sec]</b>	<b>Average interval [sec]</b>	<b>Transducer boven bodem [m]</b>	<b>Blanking Distance [m]</b>	<b>Celgrootte [m]</b>	<b>Aantal cellen</b>
C	60	30	0.68	0.4	0.4	30

In Bijlage staan de technische gegevens van Nortek Doppler Profiler (Titel: ADP specifications)

#### 2.2.4.3. Nortek AWAC

Op meetlocatie D ("Lange Brug") werd een AWAC geplaatst met frequentie van 1.0MHz. Die werd stationair in een frame op de bodem geplaatst. Er werd een extra externe batterij voorzien.

tabel 2-7 Instellingen van de stationaire Nortek AWAC op meetlocatie D

<b>Locatie</b>	<b>Profielinterval [sec]</b>	<b>Average interval [sec]</b>	<b>Transducer boven bodem [m]</b>	<b>Blanking Distance [m]</b>	<b>Celgrootte [m]</b>	<b>Aantal cellen</b>
D	60	30	0.28	0.4	0.4	30

In APPENDIX A staan de technische gegevens van de Nortek AWAC.

## **2.3. Hydro-Meteorologische condities tijdens de meetcampagne**

### **2.3.1. Getijgegevens**

#### Bron getijgegevens

Getijgegevens betreffende de meetperiode werden geleverd voor de gerapporteerde meetperiode door het Ministerie van de Vlaamse Gemeenschap - Afdeling Kust – Cel Hydrografie en Hydrometeo. De getijgegevens gedurende de 13uursmeting zijn grafisch weergegeven in APPENDIX C en de volledige getijgegevens staan gerapporteerd in rapport 1.

### **2.3.2. Logging baggerwerken gedurende de meetcampagne**

Tijdens de meetcampagne werden geen baggerwerken uitgevoerd.

### **2.3.3. Meteorologische data**

#### Bron gegevens zoetwaterlozingen

Gegevens werden geleverd door dhr. Jean-Claude Gaytant (Ministerie vd Vlaamse Gemeenschap – Cel exploitatie) en staan gerapporteerd in rapport 1.

#### Bron windgegevens

10 minutelijke windgegevens werden geleverd door het Ministerie van de Vlaamse Gemeenschap - Afdeling Kust – Cel Hydrografie en Hydrometeo en staan gerapporteerd in APPENDIX B.

### **2.3.4. Opmerkingen op de data**

Op de data van de stationaire stroommetingen uitgevoerd op meetlocatie A en C is turbulentie aan het wateroppervlak veroorzaakt door schipbewegingen tijdens de uitvoering van de mobiele 13uurs-snelheidsmeetcampagne.

Op locatie Bbis van de stationaire stroommetingen is de data van 8/10/2005 tussen 19h46 en 19h56 MET niet representatief, vermoedelijk als gevolg van shipwakes en bijgevolg niet weerhouden.

Door de geringe diepte bij laagwater is het aantal meetcellen voor de mobiele stroommetingen met ADCP zeer klein.

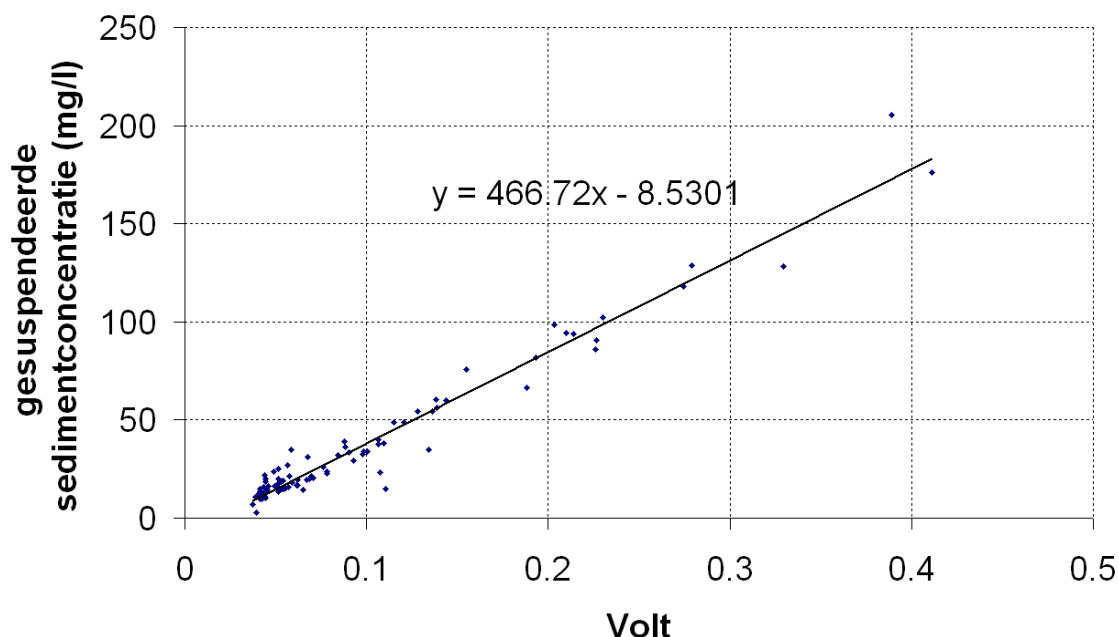

### 3. VERWERKING VAN DE DATAREEKSEN

#### 3.1. Calibratie van de turbiditeitssensor

De turbiditeitssensor werd in-situ gecalibreerd door Gems met behulp van de waterstalen die genomen zijn met de waterpomp (zie 2.2.3). Achteraf is dan van deze waterstalen de sedimentconcentratie bepaald volgens de norm NEN6484 (zie ook rapport 4).

#### OBS5 sn 14

Figuur 3-1 Calibratiecurve OBS5

#### 3.2. Methodologie van de verwerking van de ADCP data met Sediview

DRL Software's Sediview werd gebruikt om de ADCP data verder te verwerken. Deze software is ontwikkeld om de sedimentconcentratie doorheen de waterkolom te bepalen op basis van de acoustic backscatter data, die uit de ADCP van RD instruments worden gehaald.

##### 3.2.1. Acoustic backscatter theorie

De akoestische theorie die toelaat om backscatter om te rekenen naar sedimentconcentratie in de waterkolom is complex, maar de volgende vereenvoudigde formule geeft aan welke de belangrijkste factoren zijn:

$$E = SL + SV + Constante - 20 \log(R) - 2\alpha_w R$$

Where:

- $E$  = echo intensiteit,
- $SL$  = transmitted power,

- SV = backscatter intensiteit, afh. Van de hoeveelheid sediment in de waterkolom  
 $\alpha_w$  = coefficient die een maat is voor de absorptie van energie in,  
 R = de afstand tussen de transducer en de gemeten bin.

De term  $20\log(R)$  is een simpele geometrische functie die de sferische spreiding van de beam beschrijft. De constante is noodzakelijk omdat elke ADCP nog specifieke karakteristieken heeft.

Om de sedimentconcentratie in de waterkolom te kunnen bepalen is het noodzakelijk dat de intensiteit van de backscatter gerelateerd wordt met de hoeveelheid sediment aanwezig in de waterkolom. Dit verband is als volgt (afgeleid van Thorne & Campbell, 1992 en Hay, 1991 in DRL (2003)):

$$\text{Log}_{10}M_r = S\{dB + 2r(\alpha_w + \alpha_s)\} + K_s$$

Waar:

- $M(r)$  = de concentratie uitgedrukt in massa per volumeeenheid,  
 S = relatieve backscatter coefficient  
 $K_s$  = site en instrument constante  
 dB = de gemeten relatieve backscatter intensiteit (gecorrigeerd volgens de spreading van de beam)  
 $\alpha_w$  = water attenuation coefficient  
 $\alpha_s$  = sediment attenuation coefficient, welke gerelateerd is met de effectieve korrelgrootte.  
 r = afstand tussen de transducer en de gemeten bin.

In deze vergelijking blijven nog 4 onbekenden over: S,  $K_s$ ,  $\alpha_w$  en  $\alpha_s$ . Deze parameters moeten op basis van de calibraties bepaald worden in Sediview.

### 3.2.2. Waterstalen en gevaren transecten

De calibratie in sediview gebeurt op basis van de waterstalen genomen tijdens de mobiele meting (zie 2.1.1) en de CTD-OBS metingen. Deze stalen zijn zo genomen dat de ondiepe stalen overeenkomen met bin 2 of 3 en de diep stalen overeenkomen met ongeveer een halve meter boven de sidelob. De saliniteit en de temperatuur van de CTD metingen werd gebruikt om de acoustic water absorption (water attenuation coefficient) te berekenen. Al de waterstalen werden geanalyseerd zoals beschreven is in 3.1.

### 3.2.3. Calibratie van onopgeloste sediment concentratie binnen Sediview

#### 3.2.3.1. Calibratie werkset

The calibratie werkset bestaat uit ADCP-files, staalname tijden, staalname dieptes, onopgeloste sedimentconcentraties (SSC) van waterstalen en SSC, temperatuur en saliniteit van CTD-OBS data.

#### 3.2.3.2. SSC calibratie per ensemble

In de Sediview calibratie procedure moeten de site en instrumentconstante ( $K_s$ ), de relatieve backscatter coefficient (S) en de effectieve korrelgrootte. op zulk een wijze gedefinieerd worden dat de SSC geschat door Sediview overeenkomt met de SSC van de waterstalen. Deze drie te

bepalen parameters mogen binnen eenzelfde locatie onderling niet teveel verschillen, vermits deze parameters afhankelijk van omgevingscondities die weinig tot niet kunnen verschillen over korte tijdsintervallen.

### 3.2.4. Sediview configuratie

#### 3.2.4.1. Debiet en onopgeloste sedimentconcentratieschattingen

De ADCP meet het grootste gedeelte van de waterkolom van het toestel en de blanking distance tot 6% boven de bodem. Deze onderste 6% laag water nabij de bodem wordt niet gebruikt om debiet en SSC te berekenen als gevolg van interferentie met de side-lob. Wanneer de ADCP een acoustische puls uitzendt gaat een kleine hoeveelheid energie niet via de ADCP beam maar via de sidelobs uitgezonden. De reflectie van deze side lobe op de bodem kan gaan interfereren met de water echo's wat resulteert in foute data. De dikte van deze side-lob laag bedraagt 6% van de totale afstand tussen de transducer en de bodem.

Nabij de oevers is de waterdiepte te ondiep voor een ADCP profiel en het bovenste gedeelte van de waterkolom wordt ook niet gemeten doordat de transducer al een bepaalde insteekdiepte heeft en er hierbij een blankingdistance moet opgeteld worden.

Voor elk van deze ongemeten zones (zie Figuur 3-2 en Figuur 3-3) zal er binnen Sediview een afschatting worden gemaakt van zowel het debiet als de sedimentflux.

Figuur 3-2 Ongemeten zones in de cross sectie (uit RD Instruments, 2003)

Figuur 3-3 Gemeten en afgeschat debiet en sedimentflux binnen Sediview (DRL, 2005)

### 3.2.4.1.1 Top/bodem schatting

Er wordt verondersteld dat de sedimentconcentratie en het debiet aan de top van de waterkolom gelijk is aan de sedimentconcentratie en de debietwaarden van de eerste gemeten bin.

De sediment concentratie tussen de bodem en de laagst gelegen betrouwbare bin wordt berekend met de veronderstelling dat deze 125% bedraagt van de laagste betrouwbare bins

tabel 3-1 Extrapolatie waarden voor de top en de bodem afschatting

<b>Variable</b>	<b>Top</b>	<b>Bodem</b>
Discharge Method	Constant	Power
Concentration factor	100%	125%

Het debiet in de onderste 6% wordt berekend doormiddel van de 'Power' methode. Chen (1991) gebruikt de theorie van de "power laws" voor flow resistance. Simpson and Oltmann (1990) beweren dat Chen's power law equivalent is naar de formule van Manning's voor open channels (met  $b=1/6$ ) (RD Instruments, 2003).

$$u / u^* = 9.5(z / z_0)^b$$

Waarbij:

- z = Distance to the channel bed [m]
- u = Velocity at distance z from bed [m/s]
- u\* = Shear velocity [m/s]
- z<sub>0</sub> = Bottom roughness height [m]
- b = Exponent (1/6)

### 3.2.4.1.2 Schatting van de oeverdebieten

De vorm van de cross sectie nabij de oever is verondersteld lineair te zijn. De eerste vijf data ensembles die gelogd werden worden uitgemiddeld om de gemiddelde stroomsnelheid en concentratie voor deze oeverzone af te schatten.

De formule om deze oeverdebieten te bepalen is:

$$Q_{shore} = CV_m Ld_m \text{ [m}^3\text{/s]}$$

Waarbij:

- C = Coefficient (0.35 voor driehoekige, 0.91 voor rechthoekige vorm)

$V_m$  = Gemiddelde stroomsnelheid in het eerste of het laatste gemeten segment [m/s]

$L$  = afstand tussen de oever en het eerste of het laatste gemeten segment [m]

$d_m$  = Diepte van het eerste of laatste gemeten segment [m]

De coëfficiënt (C) is voor alle oevers gezet op 0.35 (driehoekig), de afstand L wordt voor iedere raai weergegeven in tabel 2-1

*tabel 3-2 De geschatte afstand tussen de oever en de eerste gemeten bin*

Cyclus	L linkeroever (m)	L rechteroever (m)	Cyclus	L linkeroever (m)	L rechteroever (m)

### 3.2.4.2. Correctie van het ADCP kompas offset

Het externe kompas op de ADCP kent een constante afwijking doordat de hoofdrichting van de ADCP niet perfect overeenkomt met de as van het schip. Deze offset werd afgeleid door het verschil te meten tussen enerzijds de ADCP bottom track en anderzijds de externe gelogde GPS-data en bedraagt  $-1^\circ$ .

## 3.3. Resultaten

### 3.3.1. Mobiele metingen

Een overzicht van de effectief gevaren raaien en de locaties van de genomen monsters staan weergegeven in APPENDIX C. Figuren van de gevaren raaien met de gemeten snelheidsvectoren staan weergegeven in APPENDIX F.

In APPENDIX H staan de stroomsnelheden, concentraties en sedimentfluxen geordend per meetraai en per meetcyclus. Elke meetcyclus bevat de volgende 5 figuren:

- De *eerste* figuur is een contourplot van de stroomsnelheden, loodrecht geprojecteerd op de theoretisch gevaren raai.
- De *tweede* figuur is een contourplot van de stroomsnelheden, parallel geprojecteerd op de theoretisch gevaren raai.
- De *derde* figuur geeft de dieptegemiddelde snelheden weer. Voor **raai 1, 3, 5 & 6** is dit de snelheidscomponent loodrecht op de theoretisch gevaren raai, voor **raai 2 & 4** is dit de snelheid parallel op de theoretisch gevaren raai
- De *vierde* figuur is een contourplot van de sedimentconcentratie.
- De *vijfde* figuur is een contourplot van de sedimentflux, loodrecht op de gevaren raai.

De X-as van al deze 5 figuren geeft de gevaren afstand mee ten opzichte van het startpunt en geprojecteerd op de theoretische raai. Voor al deze contourfiguren van **raai 1, 3, 5 & 6** is de linkeroever aan de linkerkant en de rechteroever aan de rechterkant van de figuur ingetekend. Voor al de contourfiguren van **raai 2 & 4** is het noorden aan de linkerkant en het zuiden aan de rechterkant van de figuur.

In APPENDIX I wordt voor de raaien 1, 3, 5 & 6 het temporele verloop weergegeven van het debiet en de flux en in APPENDIX G wordt voor dezelfde vier locaties de berekende debieten, fluxen en concentraties in tabelvorm weergegeven. De concentratie voor een bepaalde subsectie is berekend door van diezelfde subsectie de flux te delen door het debiet.

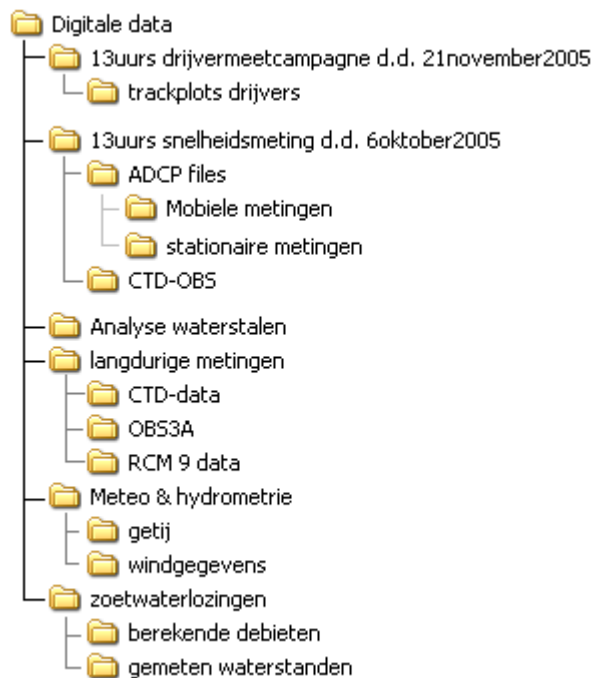

### 3.3.2. Stationaire metingen

De resultaten van de stationaire metingen staan weergegeven in APPENDIX K & APPENDIX L. In APPENDIX K wordt per locatie van elke gemeten cel respectievelijk de stroomsnelheid en de stroomrichting weergegeven over gans de waterkolom. In APPENDIX L. staan de verschillende snelheidscomponenten weergegeven, uitgemiddeld over een bepaalde diepte in de waterkolom. Voor al de locaties is de middeling gebeurd door respectievelijk de vectorgemiddelden te berekenen van de onderste 5 cellen (1-5), de 5 volgende cellen (6-10) enz. tot aan het wateroppervlakte. Aangezien voor locaties A, B en Bbis de celgrootte 0.2 m bedraagt (zie tabel 2-5) is er per stijgende meter waterkolom een vectorgemiddelde weergegeven van de oostelijke snelheidscomponent, de noordelijke snelheidscomponent, en de totale snelheidscomponent

(grootte en richting) Bij locaties C en D is elke cel 0.4 meter groot (zie tabel 2-6 & tabel 2-7) en is er bijgevolg om de 2 meter een gemiddelde berekend.

### 3.3.3. Beschrijving van de bijgeleverde digitale data

De digitale data staat geordend onder de volgende structuur. Elke file bevat een header met eventuele metadata en beschrijving van de file.

# Workhorse Rio Grande

1200 or 600 kHz HIGH-ACCURACY ADCP

## Versatile river discharge measurement system

The Workhorse Rio Grande ADCP is an accurate, rapid-sampling current profiling system designed to operate from a moving boat. The result is the fastest, safest, and most flexible method for measuring discharge.

The Rio Grande can be used for a wide range of river conditions, from shallow 30 cm-deep streams to rushing rivers and tidal estuaries where no prior discharge data exists.

The advantages will revolutionize the way you collect data, resulting in more productive, diverse, and cost-effective river surveys; reduced lifetime equipment costs; and the highest-quality data sets available.

### Measuring river discharge from moving boats

- Teledyne RDI patented BroadBand technology that allows small depth cells and fast transects in velocity and discharge measurements
- Fast, accurate, and repeatable discharge measurement
- Integration capability with external sensors: GPS, depth sounder, and gyro compass through Windows software (WinRiver)
- Low flow or weak current measurement capability with high-precision modes (equipped as standard)
  - Large depth range profiling capability that allows one unit to be used in both dry season (shallow and low flow) and flood season (high stage and strong flow) for the same site
- Windows-based data acquisition and playback software with standard discharge summary table

## 1200 or 600 kHz HIGH-ACCURACY ADCP

### Technical Specifications

Standard Mode Water Profiling				
1200kHz ZedHed	Bin Size (m)	Std. Dev. (cm/s)	Min. Range (m) <sup>1</sup>	Typical Range (m) <sup>1</sup>
	0.25	12.9	1.2	20
	0.5	6.1	1.7	22
	1.0	3.0	2.7	24
	2.0	2.0	4.8	26
600kHz	Bin Size (m)	Std. Dev. (cm/s)	Min. Range (m) <sup>1</sup>	Typical Range (m) <sup>1</sup>
	0.5	12.9	1.8	70
	1.0	6.1	2.9	80
	2.0	3.0	5	90
	4.0	2.0	9.2	100

### Special Features

Rio Grande comes complete with high-resolution modes used in special river conditions

#### 1200kHz ZedHed: shallow water, slow flow mode (Mode 11)

Bin Size (m)	Std. Dev. (cm/s)	Min. Range (m) <sup>1</sup>	Max. Range (m) <sup>1</sup>
0.05	1.0	0.3	4
0.1	0.7	0.5	4
0.25	0.4	1	4

#### 600kHz: shallow water, slow flow mode (Mode 11)

Bin Size (m)	Std. Dev. (cm/s)	Min. Range (m) <sup>1</sup>	Max. Range (m) <sup>1</sup>
0.1	0.8	0.7	8
0.25	0.5	1	8
0.5	0.4	1.6	8

#### Bottom tracking (included)

	Max. altitude (m)	Min. altitude (m)
1200kHz	30	0.75
600kHz	100	0.75

<sup>1</sup>Ranges are for fresh water, 15°C, typical sediment load.

### Standard Software

RDI's Windows™-based WinRiver

### Power

DC input: 10.5–18V DC

### Upgrades Available

- Memory: 2 PCMCIA slots, total 2GB

### New Options Available

- Shallow water bottom tracking from 30cm depth
- Fast sampling mode: selectable 10Hz, 20Hz, 40Hz

### Standard Sensors

Temperature (mounted on transducer):

Range: -5° to 45°C  
Precision: ±0.4°C  
Resolution: 0.01°

Tilt: Range: ±15°  
Accuracy: ±0.5°  
Precision: ±0.5°  
Resolution: 0.01°

Compass (fluxgate type, includes built-in field calibration feature):

Accuracy: ±2°<sup>4</sup>  
Precision: ±0.5°<sup>4</sup>  
Resolution: 0.01°  
Maximum tilt: ±15°

Note: @ 60° magnetic dip angle. 0.5G total field

### Transducer and Hardware

Beam angle: 20°

Configuration: 4-beam, transducer

Communications: Serial port selectable by switch for RS-232 or RS-422. ASCII or binary output at 1,200–115,400 baud

Internal memory: Optional flash EPROM

Velocity accuracy: ±0.25% of the (water + boat) velocity ±0.2.5cm/s

Velocity resolution: 0.1cm/s

Velocity range: ±5m/s default; ±20m/s maximum

Number of depth cells: 1–128

Ping rate: 2Hz (typical)

### Dimensions

# Aquadopp® Profiler

A small and light current profiler for coastal measurements

Longer range with 400 kHz!

The Aquadopp® profiler measures the current profile in water using acoustic Doppler technology. It is designed for stationary applications and can be deployed on the bottom, on a mooring rig, on a buoy or on any other fixed structure. It is a complete instrument and includes all the parts required for a self contained deployment with data stored to an internal data logger. Typical applications include coastal studies, online monitoring and scientific studies in rivers, lakes, and channels.

The Aquadopp® profiler uses three acoustic beams slanted at 25° to accurately measure the current profile in a user selectable number of cells. The internal tilt and compass sensors tell the current direction and the high-resolution pressure sensor gives the depth—and the tidal elevation if the system is fixed mounted. The standard 9MB recorder and internal alkaline batteries are typically sufficient for a 2–4 month deployment.

Deployment times can be increased or sampling schemes intensified by expanding to 161MB memory and external batteries.

### Practical Use

One quick glance at the Aquadopp profiler tells you that it is a small and practical current profiler that is simple to deploy. It gives you the full current profile and it comes standard with all the trimmings such as a internal recorder, compass, tilt, pressure, temperature, software, cable, etc.

Go one step further into the system and you will find a host of new features:

- ✓ Small blanking distances give you data close to the instrument
- ✓ Small cell sizes even in high flows
- ✓ Compass and tilt that automatically senses up or down orientation (use the profiler either way)
- ✓ Adjustable power output reduces battery consumption in shallow water
- ✓ All plastic and titanium parts, from 2.4kg in air
- ✓ Flexible transducer design—order special heads at low additional cost
- ✓ Powerful AquaPro Win32® software for trouble free deployment planning, recording, data retrieval, and ASCII conversion
- ✓ Online data communication via radio modem
- ✓ Collect directional wave data at 1Hz or 2 Hz in between current profiles
- ✓ Inquire for deep water versions

### Wave Directional Data

The Aquadopp can be configured to collect 1Hz or 2 Hz wave data (p,U,V) interleaved with the mean current profile. The 1Hz or 2 Hz data allow you to calculate the wave height, period, and direction, either using Nortek add-on wave software or your own algorithms. The instrument is best suited for wave measurements in areas with long waves (Tp>4–5s). For other areas or for long-term online measurements, we suggest looking at the AWAC as an alternative.

### Third Generation Current Profiler

Nortek is proud to be the first company that introduced a third generation current profiler. The first generation was the original ADCP, a bulky and expensive, but revolutionary instrument first introduced in 1982. The second

generation profilers were introduced in 1994, which reduced the size, weight, and price by about 50%. The Aquadopp profiler, introduced in 2002, repeats the feat—a 50% reduction in size, weight, and price while producing the best performance, versatility and functionality yet.

**Specifications**

**Water velocity measurement**

Acoustic frequency	0.4MHz	0.6MHz	1.0MHz	2.0MHz
Maximum profiling range*	60-90m	30-40m	12-20m	4-10m
Cell size	2-8m	1-4m	0.3-4m	0.1-2m
Minimum blanking	1m	0.50m	0.20m	0.05m
Maximum # cells	128			
Velocity Range	±10m/s (call for extended range)			
Accuracy	1% of measured value ±0.5cm/s			
Max. Sampling rate	1Hz			
Velocity uncertainty	Consult software program			

\* The Aquadop profiler measures the current profile in a user specified number of cells from the instrument out to a maximum range that depends on the acoustic scattering conditions. The lower range should be expected with clear water and small cells and the higher range with large cells and acoustically turbid water.

**Echo intensity**

Sampling	Same as velocity
Resolution	0.45dB
Dynamic range	90dB

**Transducer**

Frequency	0.4MHz	0.6MHz	1.0MHz	2.0MHz
Number of beams	3	3	3	3
Beam width	3.7°	3.0°	3.4°	1.7°

**Standard sensors**

**Temperature**  
Range: Thermistor embedded -4°C to 30°C  
Accuracy/resolution: 0.1°C/0.01°C  
Time response: 10 min

**Compass**  
Maximum tilt: Flux gate with liquid tilt 30°  
Accuracy/resolution: 2°/0.1°

**Tilt**  
Accuracy/resolution: Liquid level 0.2°/0.1°  
Up or down: Automatic detect  
Pressure: Piezoresistive

**Range**  
Accuracy/resolution: 0-100m (standard) 0.25%/0.005% of full scale

**Analog inputs**

Number of channels: 2  
Voltage supply: Battery voltage. Hardware can be modified to provide 5V or 12V  
Voltage input: 0-5V  
Resolution: 16 bit A/D

**Serial data communication**

I/O: RS232, RS422. Software supports most commercially available USB-RS232 converters  
Baud rate: 300-115200 (user setting)

**Internal recording**

Capacity: 9MB, expandable to 33, 89, or 161MB  
Data record: 32 bytes + 9×Ncells  
Mode: Stop when full (default) or wrap mode

**Software "AquaPro"**

Operating system: Windows®2000, Windows®XP  
Functions: Deployment planning, data retrieval, ASCII conversion, online data collection, and graphical display

**Power**

DC Input: 9-16VDC  
Max average consumption at 1Hz: 0.2-1.5W  
Sleep consumption: 0.0013W  
Transmit power: 0.3-20W, 4 adjustable levels

**Internal batteries**

Type/capacity: 18 AA Alkaline cells/50Wh  
New battery voltage: 13.5VDC  
Duration (10-minute avg): 80 days for 2MHz, 0.5m cells  
Duration (10-minute avg): 50 days for 1MHz, 1.0m cells  
Exact battery consumption and velocity uncertainty are complex functions of the deployment configuration. Please consult the AquaPro software for more exact predictions.

**Materials**

Standard: Delrin and polyurethane plastics with titanium screws  
Intermediate and deep-water models: Titanium and Delrin plastics

**Connectors**

Bulkhead (Impulse): MCBH-8-FS  
Cable: PMCIL-8-MP on 10-m polyurethane cable

**Environmental**

Operating temperature: -5°C to 35°C  
Storage temperature: -20°C to 45°C  
Shock and vibration: IEC 721-3-2  
Shallow water rating: 300m

**Dimensions**

Weight in air: 2.4kg/2.6kg (0.6MHz)/3.7kg (0.4MHz) with alkaline batteries  
Length: 550mm  
Diameter: 75mm

**Options**

Batteries: Lithium, Li-lo rechargeable 540Wh or 1200Wh  
External batteries  
Bulkhead connectors: Titanium instead of bronze  
Transducer head: Right angle head for 1 or 2MHz. Inquire for special configurations. Request special harness for RS422 communication.

# AWAC Wave Measurements

Optimized wave data collection measurements begins with a well designed instrument. The AWAC measures three different wave quantities that allow us to arrive the estimates of wave height and wave period. These quantities are pressure, wave orbital velocity, and surface position. The pressure is measured with a high resolution piezo-resistive element. The orbital velocity is measured by the Doppler shift along each beam. The surface position is measured with Acoustic Surface Tracking (AST), a special mode where the instrument acts as an inverted echo sounder.

The fact that waves are a random event requires that measurements are made over defined periods of time, or bursts. Typically these bursts are 512, 1024, or 2048 seconds in length and sampled at 1–4Hz.

The measurement cells and the AST window are adaptively configured during the current profile which immediately precedes the wave burst. The position and size of the velocity cell as well as the AST window are determined based on the minimum pressure. By adaptively configuring the burst measurements, the AWAC not only ensure a maximized signal level and data quality for widely varying wave conditions, but it also permits the AWAC to automatically account for extreme tidal variations.

The AWAC measures three different wave quantities that allow us to arrive the estimates of wave height and wave period. These quantities are pressure, wave orbital velocity, and surface position. The pressure is measured with a high resolution piezo-resistive element. The orbital velocity is measured by the Doppler shift along each beam. The surface position is measured with Acoustic Surface Tracking (AST), a special mode where the instrument acts as an inverted echo sounder.

## Wave Processing

The non directional wave estimates are available from the three independent spectra: pressure, velocity, and AST. The frequency range of these estimates increases respectively: pressure, velocity, AST.

The determination of wave directional estimates is a little more complicated and requires a special method of processing known as the Maximum Likelihood Method (MLM). This approach uses the three spatially separated velocity measurements as well as the AST measurement to determine a wave direction for each wave frequency. The solution attempts to determine the direction that provides the best agreement between all four of these measurements. This calculation is performed at discrete frequencies. The end result is a description of the energy distribution in both direction and frequency.

One distinct advantage of using array measurements, is that the method is capable of resolving waves at the same frequency coming from two different directions. One scenario would be identifying incident and reflected waves from a coastal structure.

## Time Series Analysis

For AST a short acoustic pulse is transmitted by the center beam and the return is finely resolved such that a sub centimeter resolution is achieved.

The AST is not subjected to attenuation as the velocity and pressure signals, so it provides a direct measurement of the free surface. This means that the AWAC is not limited to measuring just the long waves, but all ocean waves. Resolvable wave periods can be as low as 0.5 seconds.

Apart from circumventing the limitations associated with measuring an attenuated quantity, the AST provides a time series of the free surface which allows for enriched data analysis. This includes identifying nonlinear waves, evaluating transient waves (ship wake), and important time series estimates such as  $H_{max}$ ,  $H_{10}$ ,  $T_{mean}$ ,  $T_{max}$ , etc. These estimates are unique to AST and cannot be properly determined with just the velocity or pressure measurements. Furthermore, when the AST is included in the MLM solution, the directional estimates becomes much more accurate than without the AST.

Significant wave height estimates compared for the AWAC-AST (red) and the Waverider buoy (blue). Data shows both small and large wave measurement capabilities. Data was collected on the east coast of the UK in 32 meters depth.

**Specifications**

**System**

Acoustic frequency 1MHz or 600kHz  
 Acoustic beams 4 beams, one vertical, three slanted at 25°  
 Operational modes Stand-alone or long term monitoring

**Current Profile**

Maximum range 30m (1MHz), 50m (600kHz) (depends on local conditions)  
 Depth cell size 0.4 – 4.0m (1MHz)  
 0.5 – 8.0m (600kHz)  
 Number of cells Typical 20–40, max. 128  
 Maximum output rate 1s

**Wave Data**

Maximum depth 40m (1MHz), 60m (600kHz)  
 Data types Pressure, one velocity cell along each slanted beam, distance to surface  
 Cell size 0.4 – 4.0m (1MHz)  
 0.5 – 8.0m (600kHz)  
 Sampling rate (output) 1Hz/2Hz, 2Hz (4Hz AST)  
 No. of samples per burst 512, 1024, or 2048

**Velocity measurements**

Velocity range ±10m/s horizontal,  
 ±5m/s along beam (inquire for higher ranges)  
 Accuracy 1% of measured value ±0.5cm/s

**Doppler uncertainty**

Waves 3.5cm/s at 1Hz for 2m cells  
 Current profile 1cm/s (typical)

**Sensors**

**Temperature**  
 Range Thermistor embedded in head  
 -4°C to 40°C  
 Accuracy/Resolution 0.1°C/0.01°C  
 Time constant <10 min  
**Compass**  
 Flux-gate with liquid tilt  
 Maximum tilt 30°  
 Accuracy/Resolution 2°/0.1° for tilt <20°  
**Tilt**  
 Liquid level  
 Accuracy/Resolution 0.2°/0.1°  
 Up or down Automatic detect  
**Pressure**  
 Piezoresistive  
 Range 0–50m (standard)  
 Accuracy/Resolution 0.5% of full scale/ Better than 0.005% of full scale per sample

**Data Recording**

Capacity (standard) 2 MB, expandable to 26/82/154MB  
 Profile record Ncells×9 + 120  
 Wave record Nsamples×24 + 46

**Data Communication**

I/O RS232 or RS422  
 Baud rate 300–115200  
 User control Handled via "AWAC" software or ActiveX® controls

**Power**

DC input 9–16VDC  
 Peak current 2A  
 Operating power consumption 1W (typical)

R = ratio of measured conductivity to the conductivity of the Standard Seawater Solution

Conductivity Ratio R is a function of salinity, temperature, and hydraulic pressure. So that we can factor R into three parts i.e.

$R = R_t \times R_p \times r_t$

$R = C(S,t,p)/C(35,15,0)$

C = 42.914 mS/cm at 15 deg C and 0 dbar pressure ie C(35,15,0) where 35 is the salinity

Ocean pressure is usually measured in decibars. 1 dbar = 10<sup>-1</sup> bar = 10<sup>5</sup> dyne/cm<sup>2</sup> = 10<sup>4</sup> Pascal.
