As nature continues to decline at an unprecedented rate, it is crucial to understand the current state of marine biodiversity. This keynote presentation will provide an overview of the current marine biodiversity assessments and highlight existing limitations. New concepts and data infrastructures will be introduced to demonstrate how researchers and policy makers can make better assessments. The presentation will showcase the potential of current systems and technologies to accelerate marine data science. Importantly, young marine researchers will learn how they can play a significant role in these efforts and will be able to utilize these developments for their own research.
