# Decapoda, Dendrobranchiata

Taxonomy and nomenclature follow Pérez-Farfante and Kensley (1997). Keys to family level are modified from Dall *et al.* (1990).

## Larval stages

Numbers of larval stages in NE Atlantic Dendrobranchiates

Family	Nauplius	Protozoaea	Zoea (Mysis)	Post-larva (Megalopa)
Aristeidae	?	3	?	?
Benthescymidae	?	3	4+	?
Penaeidae	3–8	3	(2–)3–5	1–6
Sicyonidae	8	3	4	Many?
Solenoceridae	?	3	4+	1?
Sergestidae	2+	3	2	Many
Luciferidae	2+	3	2	Many

## Nauplii

The nauplii of the Eucaridea are distinguished from those of other crustacean superorders by the lack of masticatory spines at the base of the antenna or mandible (Williamson, 1982). The first nauplii are pyriform, with two posterior spines in Dendrobranchiates (absent in NI stage of Euphausiacea) and only three pairs of limbs. The last stages are metanauplii with buds of maxillules, maxillae and maxillipeds present and with distinct abdomen. The abdomen extends well beyond the posterior margin of the carapace and is distinctly bilobed. In contrast, the abdomen of euphausiid metanauplii has no more than a slight median indentation and barely extends beyond the posterior margin of the carapace.

## Key to genera

### Protozoaea (Elaphocaris)

- Carapace with spines or processes  
Carapace smooth 2
- Carapace margin serrate, spines robust  
Carapace posterior margin with 3 small spines  
Carapace margin smooth, spines long and slender 3
- Protozoaea II and III: lateral and posterior processes without long spines 4

*Sergia* (Fig. 2j–k)

Protozoaea II and III: lateral and posterior processes with long lateral spines or long spines at their bases

*Sergestes*  
(Fig. 2f–i)

- Rostrum very short, length of antennule (A1) 2× that of (A2) antenna  
Rostrum at least reaching the ocular peduncle, antennule length <2× antenna length 5
- Carapace with two pairs of supraorbital spines  
Carapace with or without one pair of supraorbital spines 6
- Supraorbital spines small; telson with 7+7 terminal spines  
Supraorbital spines prominent; telson with 8+8 terminal spines 7
- Posterior end of supraorbital spines bifurcate  
When present, supraorbital spines never bifurcate 8
- Telson with deep invagination; Protozoaea III with dorsal spines on abdominal segments  
Telson with median invagination; Protozoaea III without dorsal spines on abdominal segments 9
- Antennule shorter than antenna; rostrum slender at base  
Antenna shorter than antennule; rostrum enlarged at base 10

*Gennadas*

*Aristeus* (Fig. 1a)

*Aristaeomorpha*

### Zoea (Mysis or Acanthosoma)

- Carapace with many spines or processes  
Carapace smooth 2
- Carapace margin serrate, spines robust  
Carapace margin smooth, spines long and slender 3
- Dorsomedian spines absent on abdominal somites 1–5  
Dorsomedian spines present, at least on abdominal somite 5 4
- Rostrum short, not reaching the ocular peduncles 5

*Solenocera*

*Sergestes* and

*Sergia*

(Figs 1f, 2l–q)

4

7

5

Rostrum longer than ocular peduncles	6
5. Abdominal somites with ventral spines	<i>Lucifer</i>
Abdominal somites without ventral spines	<i>Sicyonia</i>
6. Carapace with pterogostomian spine	<i>Aristeus</i>
Carapace without pterogostomian spine	<i>Aristaeomorpha</i>
7. Four or five ventral-median spines on abdominal somite 6	<i>Funchalia</i>
Ventral margin of abdominal segment 6 without spines	8
8. Dorsomedian spine on abdominal somite 2	9
Without dorsomedian spine on abdominal somite 2	10
9. Dorsomedian spine on abdominal somite 2 longer than the others	<i>Gennadas</i> (Fig. 1b)
Dorsomedian spine on abdominal somite 2 very minute	
10. Large dorsomedian spine on abdominal somite 3	<i>Melicertus</i>
Minute dorsomedian spine in Z1 only	<i>Parapenaeus</i> (Fig. 1d)
Without dorsomedian spine on abdominal somite 3	<i>Marsupenaeus</i>

Post-larva (mastigopus or megalopa) –  
Key to families

1. Pereopods 1–3 all chelate	2
Pereopods 1 or 2 non-chelate, 4 or 5 rudimentary or absent	
2. Cervical sulcus present	
Cervical sulcus absent	3
3. Ventromedian spines on abdominal somites	
No ventromedian spines on abdominal somites	<i>Penaeidae</i>
	<i>Aristeidae</i> and <i>Benthesicymidae</i>

#### Sergestidae

Key to described protozoa and zoea stages mainly from descriptions in Gurney and Lebour (1940).

The larvae described by Gurney and Lebour as “*Sergestes robustus C*” are tentatively referred to *Sergia japonica*. The larvae have been recorded off Bermuda and New Zealand (Gurney and Lebour, 1940) as well as off the Portuguese coast (A. dos Santos, unpublished). Known distributions within the North Atlantic

(Vereshchaka, 1994) and globally (Pérez-Farfante and Kensley, 1997) indicate that *Sergia japonica* is the only species of the genus with undescribed larvae with distributions consistent with the occurrences of the larvae. Also, the larvae described by Gurney and Lebour as “*Sergestes corniculum* Form A” are probably *Sergestes curvatus*. The larvae have been recorded off the Portuguese coast (A. dos Santos, unpublished). Crosnier and Forest (1973) showed that “*Sergestes corniculum* Form B” of Gurney and Lebour are larvae of *S. hensenii*.

#### Key to species

Protozoa I (eyes sessile, no rostrum, abdomen unsegmented).	
1. Anterior carapace processes with 4 branches	2
Anterior carapace spines with 3 branches	3
2. Branches of anterior carapace spines smooth	“ <i>S. robustus C</i> ” ( <i>Sergia japonica?</i> ) (Fig. 2e)
Branches of anterior carapace spines denticulate	3
3. Lateral processes with 6 basal spines	<i>Sergestes curvatus</i> (Fig. 2d)
Lateral processes with 3 basal spines	<i>Sergestes hensenii</i>
4. Median branch only of anterior carapace process with denticles	<i>Sergestes vigilax</i> (Fig. 2b)
All branches of anterior carapace process with denticles	5
5. Telson forks length >3 × width	<i>Sergestes atlanticus</i> (Fig. 2a)
Telson forks length only slightly greater than width	<i>Sergestes arcticus</i> (Fig. 2c).

Protozoa II–III (eyes stalked; PII uropods absent; III uropods present)

1. Lateral and posterior carapace processes without lateral spines but with long spines around the base	2
Lateral and posterior carapace processes without long lateral spines, spinules present at base	3
Supraorbital, lateral and posterior carapace processes with numerous long lateral spines	4
2. Lateral lappets of carapace with >9 spines	<i>Sergestes hensenii</i>

Lateral lappets of carapace with < 10 spines	<i>S. curvatus</i> (Fig. 2g)	Lateral spines on abdominal segments 1 and 5 the longest, those on segment 3 about equal to segment, eyestalk $> 2 \times$ eye width, supraorbital spine shorter than eyestalk	<i>"S. robustus C"</i> ( <i>S. japonica</i> ?) (Fig. 2q)
3. Carapace processes shorter than carapace, lateral carapace processes almost parallel with body	<i>"Sergia robustus C"</i> ( <i>S. japonica</i> ?) (Fig. 2k)	Lateral spines on abdominal segments with long spinules at base, eye asymmetrical, eyestalk approximately equals width of eye, supraorbital spines longer than eyestalk	<i>Sergestes sargassi</i> (Fig. 1e)
Carapace processes longer than carapace, lateral carapace processes clearly diverging from the body	<i>S. robusta</i> (Fig. 2j)	Lateral spines on abdominal segments decrease in length from segment 1 to segment 5	5
4. Spines on carapace processes multifid at tip ("brush-ended")	<i>Sergestes arcticus</i> (Fig. 2h)	5	<i>Sergestes arcticus</i> (Fig. 2n)
Spines on carapace processes smooth at tip			
5. Spines arising from swollen base of posterior carapace process, none from distal part	<i>Sergestes atlanticus</i> (Fig. 2f)	Eye $\pm$ symmetrical, eyestalk length about $3 \times$ width of eye, supraorbital spine shorter than eyestalk	<i>Sergestes atlanticus</i> (Fig. 2l)
No swollen base to posterior carapace process, spines on distal part	<i>Sergestes vigilax</i> (Fig. 2i)	Eye asymmetrical, eyestalk about $1.5 \times$ width of eye, supraorbital spine about equal to eyestalk length	

## Zoea

1. Carapace without posterior dorsal spine, eye asymmetrical, supraorbital spine longer than eyestalk, lateral spines on abdominal segments approximately equal with long spinules
  2. Carapace with posterior dorsal spine
    2. Eyestalk about  $2 \times$  width of eye  
Eyestalk  $< 1.5 \times$  width of eye
    3. Lateral spines on abdominal segment 3 longest, those on segments 1–3 with spinules on 4 and 5 simple, eye asymmetrical, eyestalk length  $1.5–2 \times$  width of eye supraorbital spine about equal to eyestalk
      4. Lateral spines on segment 3 not the longest
      4. Lateral spines on abdominal segments  $> 2 \times$  length of segments from which they arise, those on segment 5 longest, eye  $\pm$  symmetrical, eyestalk  $> 2 \times$  eye width, supraorbital spine shorter than eyestalk
