日本産ヒザラガヒ類の研究 (4)
Studies on Japanese Chitons (4)

瀧 庸 潤 岩

(By ISAO TAKI and IWAO TAKI, brothers.)

(Zoological Institute, Faculty of Science, Imperial University of Tokyo) (Zoological Institute, Science College, Kyoto Imperial University)

Cryptoplax propior, new species.

(Pl. III, figs. 59-75)

General appearance: Body vermiform, rather short and elevated, with reduced valves, the anterior four valves loosely imbricate, the rest being slightly separated from each other. Tegmental surface longitudinally striated, brownish. Girdle wide, densely covered with brownish spicules.

Head valve (figs. 59-61): Horse-shoe shaped in outline, slightly narrower in front, the apex (fig. 60) not elevated, weakly beaked. Sculpture of tegmentum eroded and inconspicuous, however, it seems to be decorated with radial granulose ridges, deeply interrupted by a few concentric growth lines. Insertion plate well developed, smooth; slits 3, each of them connected with a radial shallow groove on its dorsal side. Interior with a number of deeply excavated muscle impressions (fig. 61).

Median valve (figs. 64, 67, 68): The valves behind the fourth are discontinuous, each being separated by an almost equidistant space, which is shorter than the length of any median valve; this forms one of the distinguishing characters of this species. All median valves rather flat, oblong and slightly beaked posteriorly. The second valve (figs. 67, 68) shorter but wider

(99).

than the tail valve (fig. 65), jugum smooth, not sharply marked off from the latero-pleural area, which is provided with many low granules or inconspicuous longitudinal beaded ridges; sutural plate thick and short, auriculate, jugal sinus wide and shallow.

The other (3rd-7th) median valves (fig. 64) are nearly equal in length; jugum distinct, latero-pleural area with longitudinal ridges, showing a somewhat granulose feature; sutural plate much thickened, axially elongated; sinus rather shallow. Sculpture of latero-pleural area coarser than that of the second valve, though finer than in specimens of *C. japonica* of corresponding size.

Tail valve (figs. 65, 66): Jugum very distinct and smooth, sculpture of latero-pleural area similar to the median valve, viz., with about 8 somewhat beaded, axial ridges; mucro retracted to the terminal, protruded far behind; sutural plate short, narrowly triangular, insertion plate thick and vertical, posterior area somewhat concave; interior beneath the mucro deeply excavated.

Spicules densely clothing the girdle are of unequal sizes, slightly curved except the marginal ones; which are either very thick ($330 \times 100\mu$: fig. 62) or rather slender ($380 \times 70\mu$: fig. 71), bluntly pointed, and with numerous longitudinal weak striations; minor spicules ($100 \times 20\mu$: fig. 69; $140 \times 30\mu$: fig. 70) also occur with the larger ones. Tufts of setae inconspicuous, probably due to unfavourable preservation of material.

Ctenidia: Merobranchial, adanal, about 20 on each side, approximately corresponding to the posterior third of the entire length of the foot (fig. 74).

Colouration: Segmental surface generally dark brown, posterior part of each valve eroded and faintly roseate. Interior pale white, sometimes greenish in the central part. Girdle unicoloured, i.e., reddish brown throughout, without any colour band as is the case in *C. japonica*.

Radula (figs. 75, a-e): General features of the radula resemble that of *C. japonica*. Central tooth (fig. 75 a) oblong, without any appendage on its tip; centro-lateral (fig. 75 b) roughly rhombic, thin, its outer margin recurved inward, with a triangular basal plate in front; major lateral (fig. 75 c) tricuspid, its median

cusp being longest and sharp, inner cusp short and thick, almost as long as the outer one, which is slender; stalk fusiform, stout, weakly longitudinally striated; major uncus (fig. 75 *d, e*) slender, oar-shaped, curving moderately inward, with rounded end.

Measurements: The specimen in spirit measures 17.4 mm. in length, 7 mm. in breadth in its contracted and curved condition; however, if stretched, it would attain a length of as much as 33 mm. Length of individual plate is as follows:

head valve 3.3 mm., second valve 3.9 mm.,
fifth valve 4.4 mm., tail valve 4.3 mm.

Angle of divergence of the second valve (fig. 68) about 120°.

Locality: Holotype was collected in Prov. Shima by Mr. TOMOHARU YAMADA in 1929, to whom we express our sincere thanks for his kindness in placing the material at our disposal.

Remarks: As early as in 1874, TAPPARONE-CANEFR¹⁾ recorded a *Chitonellus fasciatus* from Japan. This name, however, has not been referred to by any subsequent authors. It seems quite probable that he had meant PILSBRY's species, which he misidentified. Later, in 1898, PILSBRY²⁾ established two new species, *Cryptoplax japonicus* [sic]³⁾ and *C. rhodoplax* from Japan, with insufficient descriptions. He wished to give more detailed accounts on these species if he could procure further material available for study; but this has not been realized. THIELE (1909)⁴⁾, based on his elaborate anatomical works, placed *rhodoplax* as synonymous with *japonica*, with this view we concur. Thus, among the members of the genus *Cryptoplax* only *C. japonica* is known from Japan thus far, and the present species forms the second member of this genus occurring in Japanese waters.

The following features may be sufficient to distinguish this species from *C. japonica*.

- 1) TAPPARONE-CANEFR^I, C. 1874. Zoologia del Viaggio intorno al Globo della regia fregata Magenta, durante gli anni 1863-68. Malacologia, p. 78.
- 2) PILSBRY, H. A. 1901. Proc. Acad. Nat. Sci. Philadelphia, vol. 53, p. 204.
- 3) THIELE (1909, p. 20, foot-note) has already pointed out that "plax, πλάξ" is a feminine noun.
- 4) THIELE, J. 1909. Revision des Systems der Chitonen. I. Zoologica, Bd. 22, Heft 56, S. 54.

1. The space between the 5th, 6th, 7th and 8th valves is respectively shorter than the length of each median valve.
2. Tegmental sculpture is finer than in *C. japonica*.
3. Sutural plate is much shorter and jugal sinus is shallower.
4. Mucro of tail valve strongly protruded backward.
5. Girdle spicules are thick and blunt.
6. There are no transverse brown bands on the girdle.

Cryptoplax propria (新種) イモムシガヒ (新稱) (第 III 圖版; 59—75)

本種は既知 *C. japonica* PILSBRY (= *C. rhodopla*x PILSBRY) ケムシヒザラガヒに比して、第 5—8 裂板が接近してゐて、その間隔は中間板の長さよりも短いこと、殻表の彫刻が一層緻密で縫合板は著しく短く溝入が淺く、尾板の尾殻頂が後方に突出して居り、肉體上の刺は太くて短く鋭く尖つてゐない；又褐色の横縞状の斑紋が全くないこと等より容易に區別せられる。體長 17.4 粑 (伸長すれば 33 粑にもならう)。志摩にて山田知治氏採集 (1929)。

List of the known species of the genus *Cryptoplax*.

The following is a list of the members of this genus hitherto recorded, together with their synonymies and habitats.

Genus *Cryptoplax* BLAINVILLE, 1818.

Type, *Chiton larvaformis* BURROW, 1815.

1. CRYPTOPLAX BURROWI (E. A. SMITH, 1884).

Chitonellus larvaformis (non BLAINVILLE) REEVE (1847) Conch. Icon., vol. 4, Chitonellus, f. 3.

Chitonellus burrowi E. A. SMITH (1884) Zool. Collect. H. M. S. "Alert," p. 85.

Cryptoplax burrowi HADDON (1886) Challenger Report, Zool. vol. 15, Polyplacophora, p. 42-45, pl. 3, f. 11a-11m; PILSBRY (1893) Man. Conch., vol. 15: 54-55, pl. 9, f. 6-10; PILSBRY (1900) Proc. Mal. Soc., 4: 152; NIERSTRASZ (1905) Siboga-Exped., monogr. 48: p. 71-73, pl. 2, f. 26, 27; pl. 5, f. 141-150; E. A. SMITH (1906) Fauna & Geography Maldives & Laccadive Arch., vol. 2: p. 596, 620; SYKES (1907) Journ. Linn. Soc. Zool., 31: 33; THIELE (1909) Rev. Syst. Chitonen, I. Zoologica, 22 (56): 53, 56; ASHBY (1923) Trans. Roy. Soc. S. Austr., 47: 242.

Wasin, East Africa (SYKES); Hulule Is., 1-6 fms, Maldives Arch. (E. A. SMITH); Straits of Macassar (BELCHER; THIELE); Sulu Arch., 15 m.; near Sulu Arch., 16-23 m.; Damar Is.; Banda Is., reef; near Banda, 141 m.; Kei Is., reef (Siboga); Port Adelaide, S. Australia (REEVE); Port Moller (COPPINGER).

2. CRYPTOPLAX CALEDONICA ROCHEBRUNE, 1881.
Cryptoplax caledonicus ROCHEBRUNE (1881-'82) Bull. Soc. Philom. Paris, p. 196; PILSBRY, (1893) Man. Conch., 15: 58-59; THIELE (1909) Zoologica, 22 (56): 52, 55-56, pl. 6, f. 97-102.
Cryptoplax uniciferus ROCHEBRUNE (1881), l. c., p. 197.
 New Caledonia (Paris Museum).
3. CRYPTOPLAX ELIOTI PILSBRY, 1900.
Cryptoplax elioti PILSBRY (1900) Proc. Malac. Soc. London, 4: 152, 153-154, pl. 14, f. 1-11; NIERSTRASZ (1905) Siboga-Exped., 75-76, pl. 2, f. 29, 30; pl. 6, f. 159-161; THIELE (1909) Zoologica, 22 (56): 56.
 Apia, Samoan Is. (Sir C. ELIOT); Upolu, Samoan Is. (Hamburg Museum); East of Timor, 27-54 m. (Siboga).
4. CRYPTOPLAX EVANESCENS COOK, 1913.
Cryptoplax evanescens COOK (1913) Proc. Malac. Soc., 10: 320-322, with text-figs.; THIELE (1929) Handb. syst. Weicht. 1, textf. 8.
 Funafuti, Ellice Is., South Central Pacific (J. S. GARDINER).
5. CRYPTOPLAX HEURTELI ROCHEBRUNE, 1881.
Cryptoplax heurtei ROCHEBRUNE (1881-'82) Bull. Soc. Philom. Paris, p. 196; PILSBRY (1893) Man. Conch., 15: 59; THIELE (1909) Zoologica, 22 (56): 52, 56, pl. 6, f. 103-107.
 New Caledonia (Paris Museum).
6. CRYPTOPLAX IREDALEI ASHBY, 1923.
Cryptoplax iredalei ASHBY (1923) Trans. Roy. Soc. S. Austr., 47: 238, pl. 17, f. 4.
 Port Lincoln, Gulf of St. Vincent (ASHBY); North-western Tasmania (L. MAY); South Australia, Tasmania (ASHBY).
7. CRYPTOPLAX JAPONICA PILSBRY, 1901.
 ? *Chitonellus fasciatus* TAPPARONE-CANEFRY (1874) Viaggio al globo fregata Magenta, Malac., p. 78.
Chitonellus larvaformis THIELE (1893) Das Gebiss der Schnecken, no. 120.
Cryptoplax japonicus PILSBRY (1901) Proc. Acad. Nat. Sci. Philad., 53: 204.
Cryptoplax japonica THIELE (1909) Zoologica, 22 (56): 4, 8, 54-55, pl. 6, f. 90-96.
Cryptoplax rhodoplax PILSBRY (1901) l. c.; THIELE (1909) l. c., p. 54-55.
 Hirado, Hizen, Japan (HIRASE); Sea of Japan (Magenta); Hakodate (HILGENDORF); Enoshima (DÖDERLEIN); Nagasaki (BUNGE).
 Kyūshū; Shikoku; Honshū (TAKI).
8. CRYPTOPLAX LARVAEFORMIS (BURROW, 1815).
Cryptocnchus larvaeformis BLAINVILLE (1815) BURROW's Elements of Conch., p. 190 (no description).
Chiton larvaeformis BURROW, l. c., p. 191, pl. 28, f. 2-4.
Cryptoplax larvaeformis BLAINVILLE (1818) Dict. des Sci. Nat., 12: 124; HADDON (1886) Challenger Polyplac., 37-39, pl. 3, f. 12a-12m; PILSBRY

化石 *Glycymeris yessoensis* の變異 On the Variation of the Fossil *Glycymeris* *yessoensis*

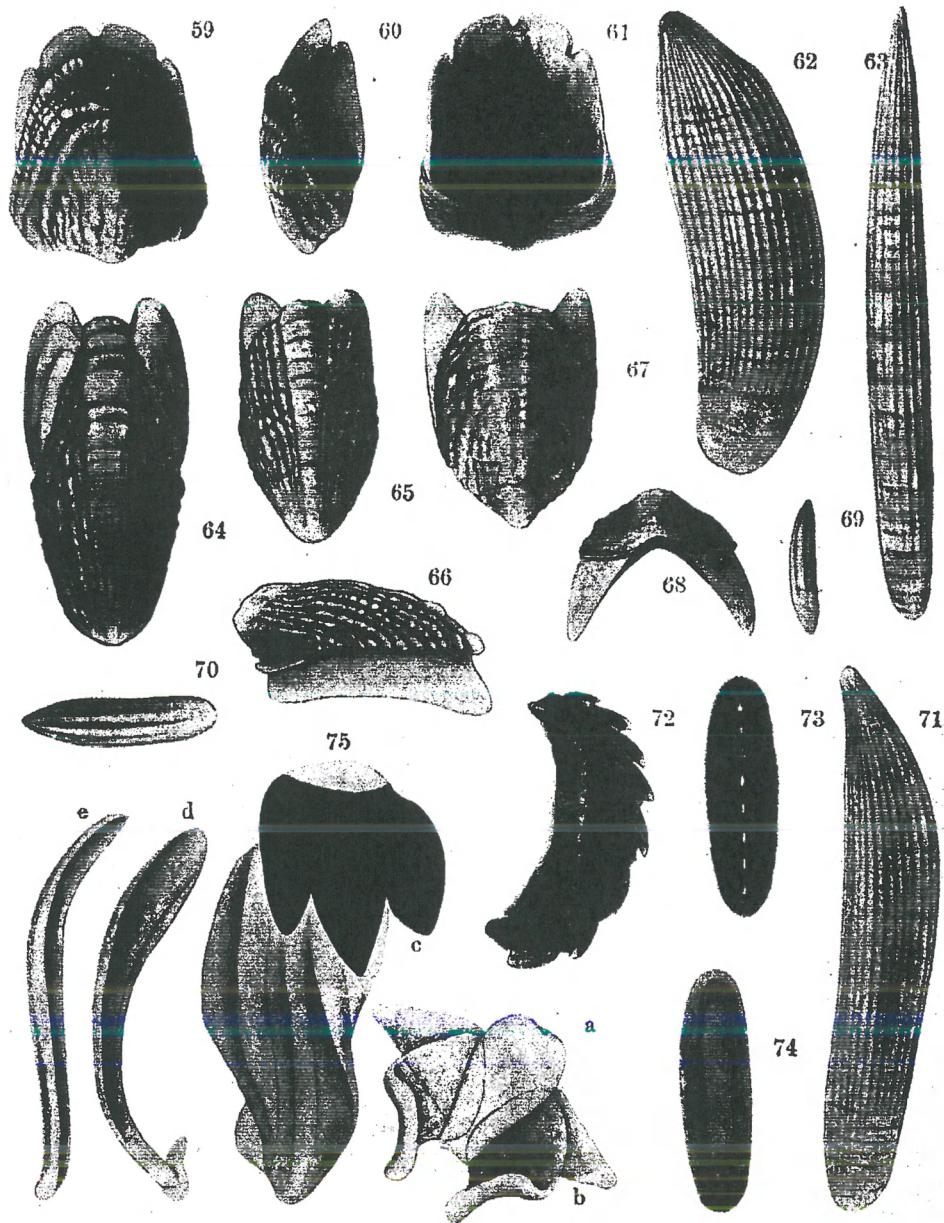

横山 次郎 By J. MAKIVAMA

ABSTRACT

The material upon which this investigation is based consists of seven series of detached valves of *Glycymeris yessoensis* (SOWERBY) obtained from the Upper Pliocene and Pleistocene rocks of this country. Series A, B, and C were collected from three fossil localities in Oga Peninsula, North Japan, and the remaining four series from the Pleistocene sands at Itabasi near Tokyo, and three localities in Boso Peninsula. The length of the shell was measured as usual, but diameter B
