NOAA Technical Memorandum NMFS

The National Oceanic and Atmospheric Administration (NOAA), organized in 1970, has evolved into an agency which establishes national policies and manages and conserves our oceanic, coastal, and atmospheric resources. An organizational element within NOAA, the Office of Fisheries is responsible for fisheries policy and the direction of the National Marine Fisheries Service (NMFS).

In addition to its formal publications, the NMFS uses the NOAA Technical Memorandum series to issue informal scientific and technical publications when complete formal review and editorial processing are not appropriate or feasible. Documents within this series, however, reflect sound professional work and may be referenced in the formal scientific and technical literature.

NOAA Technical Memorandum NMFS

This TM series is used for documentation and timely communication of preliminary results, interim reports, or special purpose information; and have not received complete formal review, editorial control, or detailed editing.

REPORT OF A MARINE MAMMAL SURVEY OF THE EASTERN TROPICAL PACIFIC
ABOARD THE RESEARCH VESSEL DAVID STARR JORDAN
JULY 29 - DECEMBER 7, 1989

P. Scott Hill
Alan Jackson
and
Tim Gerrodette

In 1984, as a result of an amendment to the Marine Mammal Protection Act of 1972, the National Marine Fisheries Service (NMFS) was mandated to conduct a research program to monitor trends in the abundance of stocks of dolphins in the eastern tropical Pacific (ETP). These dolphins are killed incidentally during fishing operations by the U. S. purse seine fishery for yellowfin tuna (Thunnus albacares). In 1986, the Southwest Fisheries Center (SWFC) of the NMFS initiated a six-year program to monitor these stocks of dolphins. In the first three years of the program (1986 through 1988), two surveys of marine mammal populations in the ETP were conducted concurrently each year aboard the National Oceanic and Atmospheric Administration vessels David Starr Jordan and McArthur. The surveys lasted 120 days each. In 1989, the fourth pair of surveys was conducted during the same period of time and using the same vessels.

In this report, we describe the experimental procedures used during the surveys and we present summaries of the distance searched and marine mammals encountered from aboard the David Starr Jordan (Cruise DS-89-05 (222); SWFC Observer Cruise 1267). A separate report of the McArthur cruise has been published by Hill et al. (1990). A report of environmental data collected during the survey is reported by Lierheimer et al. (1990).

SURVEY OBJECTIVES

The primary objective of the cruise was to collect information to calculate relative abundance of dolphin species in the ETP that are taken incidentally by the purse seine fishery for yellowfin tuna. Specific objectives were to collect information to:

1. estimate school density, school size, and species composition of each species taken by the fishery;
2. calibrate observers' estimates of dolphin school size with counts of school sizes obtained from photographs taken from a ship-based helicopter;
3. investigate the physical and biological environment of the affected species; and

4. contribute to on-going U.S. and international programs investigating oceanography and ocean-atmosphere interactions in the ETP.

MATERIALS AND METHODS

Study Area and Itinerary

The David Starr Jordan, herein referred to as the Jordan, traversed predetermined tracklines in the ETP from July 29 through December 7, 1989 (Figure 1), with port calls in Puerto Quetzal, Guatemala; La Libertad, Ecuador; and Manzanillo, Mexico. The itinerary of the vessel included four segments or effort legs:

Leg 1.	Departed	San Diego	July 29
	Arrived	Puerto Quetzal	August 27
Leg 2.	Departed	Puerto Quetzal	September 3
	Arrived	La Libertad	September 30
Leg 3.	Departed	La Libertad	October 5
	Arrived	Manzanillo	October 25
Leg 4.	Departed	Manzanillo	November 1
	Arrived	San Diego	December 6

The Jordan conducted photographic censuses of California sea lion rookeries located on the following Mexican islands: Isla Cedros, Islas San Benitos, Isla Natividad, and Isla Asuncion. The Jordan also conducted bird censuses on Isla del Coco (Costa Rica), Isla San Benedicto (Mexico), and Isla La Plata, (Ecuador).

The Jordan experienced several problems throughout the survey which forced the vessel to make unplanned stops. An urgent medical problem developed which necessitated a stop on August 11 in Manzanillo, Mexico, in order to transfer personnel. The Jordan departed from Puerto Quetzal, Guatemala, one day later than scheduled due to a generator malfunction. A helicopter transmission problem required the vessel to stop in Acapulco, Mexico, between September 11 and September 14. A generator breakdown caused the third inport (Manzanillo) to be moved ahead eight days, which in turn compelled the Jordan to stop for fuel in Manzanillo on November 30 before returning to San Diego.

Marine Mammal Species Surveyed

During the survey, the observers recorded information on all species of whales and dolphins sighted throughout the cruise. However, encounter rates are presented only for dolphin species.

Equipment

The Jordan, commissioned in 1964, is 52.1 m in length, has a beam of 11.2 m, and has a 3.8 m draft. During the survey, the vessel maintained a cruising speed of approximately 18.5 km/hr.

Several pieces of equipment were used to gather data. The geographic position of the vessel was recorded periodically and at the time of a marine mammal sighting using the vessel's Satellite Navigation System (SAT NAV). Marine mammals were detected with port and starboard pedestal mounted 25X Fuginon¹ binoculars and a variety of hand-held 7-50X binoculars. The 25X glasses were mounted on the upper deck approximately 10.7 m above the sea surface. Surface temperature and salinity, fluorescence (chlorophyll), and temperature-depth profiles were obtained using a thermosalinograph, fluorometer, and expendable bathythermographs (XBTs), respectively. Discrete conductivity and temperature-depth profiles were also obtained using conductivity-temperature-depth (CTD) probes.

The bearing and radial distances of marine mammals from the vessel were calculated using two methods. The first method was the use of estimates of the bearing and radial distance of a school from the vessel, which were recorded by the observers using a 360° graduated washer attached to the base of the 25X binoculars and graduated reticles enclosed in the right eyepiece of the binoculars.

The second method utilized the Computer Assisted Sighting Technology (CAST) system using information from several sensors to measure sighting angles and then to calculate radial distances. A CAMAC¹ computer collected data from various sources: the vessel's course from the gyroscope; the electronically encoded sighting angles of the 25X binoculars; a measurement of the relative motion of the vessel from a pitch-roll sensor; speed from the speed log; and information concerning survey status, such as identification of observers occupying survey positions from data pads located on the flying bridge. An IBM-compatible computer, which was interfaced

¹Reference to trade name does not imply endorsement by NMFS.

with the CAMAC, was then used to process information to determine the sighting angle to the cue. Successive sighting angles, recorded as the vessel traveled along the trackline, were used to calculate radial distances. Analyses of CAST data will be presented in a separate report.

A 35 mm F-1 Canon¹ camera with motor drive was used to photograph animals to aid in stock and species identification. The system included 400 mm, 70-210 mm zoom, 50 mm, and 28 mm lenses. Some observers used personal camera equipment to photograph sightings. Animals were also recorded on 1.27 cm video tape using a Panasonic¹ VHS recorder and a Panasonic¹ camera equipped with telephoto lens.

Duty Stations

Three duty stations were used during the survey, with observers rotating through each station.

1. Left Binocular - The port-side observer used a 25X binocular, mounted on the port side of the vessel, to scan the ocean for marine mammal sighting cues. The major area of responsibility for this observer was from the midpoint of the trackline to abeam the port side of the vessel and outward to the horizon or to the extent possible with prevailing environmental conditions.
2. Right Binocular - The starboard observer used a 25X binocular, mounted on the starboard side of the vessel, to search from the midpoint of the trackline to abeam the starboard side of the vessel, and outward to the horizon or to the extent possible with prevailing environmental conditions. Observers in the left and right positions frequently searched up to 10° on the opposite side of the trackline.
3. Recorder - The recorder's duties were to transcribe transect effort data at regular intervals, to make notes of information pertaining to each sighting, and to search the trackline adjacent to the vessel with hand held binoculars for schools not detected by the observers on the 25X glasses.

Observer Teams and Rotation

Two teams of three observers each alternately occupied the three duty stations. Each team was on duty for a two-hour shift. During each shift observers spent approximately equal time occupying each duty station. Teams alternated standing the first watch of the day.

Two of the six observers, one on each team, were experts in identifying marine mammals. Team composition remained constant

during the entire survey. Team members rotated between the duty stations and teams rotated on and off duty without interrupting searching effort. Observers aboard the Jordan and McArthur switched vessels after the second leg, allowing school size estimates for all observers to be calibrated with the ship-based helicopter aboard the Jordan.

Data Collection Procedures

A typical day's searching activity began at sunrise, approximately 0630 hours local time, and ended at sunset, approximately 1830 hours local time. The searching procedure was initiated when observers were occupying the duty stations and a recorder was in place to record information on the Research Vessel Effort Form (Figure 2). Except for approximately two to three hours per night when oceanographic data were collected, the vessel maintained its speed and course between sunset and sunrise to provide wider spatial distribution of searching effort.

When a sighting cue (marine mammals, birds, splashes, etc.) was detected, it was determined whether marine mammals were present and if the sighting was appropriate for tracking using the CAST system. Schools that were not tracked included whales, dolphins detected close to the vessel or at distances greater than 5.6 km lateral to the vessel, small schools of dolphins (<15 animals), and schools detected during poor sighting conditions. If tracking was appropriate, the searching effort was terminated and the observer initiated tracking by turning on a switch attached to the binocular stand. With the vessel maintaining course and speed, and with the school in the field of view of the binoculars, the CAST system recorded successive bearings from the vessel to the animals. After approximately eight minutes the vessel was directed towards the cue and the tracking continued for another eight minutes. When the target was not in the field of view, the switch was turned off until the target was again sighted. The tracking procedure was terminated if the target was lost from view and not resighted, or if the cue was found to be inappropriate for tracking. All marine mammal schools were approached to obtain estimates of school size and species composition. The searching mode was resumed after the vessel returned to original course and speed and the observers resumed searching for other sighting cues.

During each marine mammal sighting, the recorder collected data necessary to complete Research Vessel Effort and Research Vessel Sighting forms (Figure 3). Definition of each data element is given by Ralston². Criteria for assigning sun position and sea state conditions are given in Figure 4 and Table 1, respectively.

²Ralston, F. Ms. Usage procedures and coding notes for research vessel sighting and effort records. Southwest Fisheries Center, P. O. Box 271, La Jolla, CA 92038.

Observers recorded bearing and range to the mammals using the 360° washer and reticles etched into the right eyepiece of the 25X binoculars. The reticle measurements were converted to km using

$$a = 0.003942 \tan (\arctan (45242.52) - 0.001088 r),$$

where a equals radial distance in km and r denotes the number of reticles below the topmost reticle. Values in this equation were calculated by Barlow (per. comm.) using an equation presented by Smith (1982) and data collected during previous research vessel cruises.

Each observer who had a good view of the school independently recorded, in his or her logbook, high, low and best estimates of school size and a determination of species composition. At no time were the observers allowed to discuss their estimates of school size and species composition. This procedure assured independence and consistency of each observer's data, and will allow individual correction factors to be developed from aerial photographs. On a daily basis the cruise leader (chief of the scientific party aboard the vessel) collected the individual logbooks and transcribed observer estimates of school size and species composition to complete the Research Vessel Sighting Forms.

However, all available observers did discuss species identification and animal behavior, and a consensus was entered on the Research Vessel Sighting and Research Vessel Continuation Forms (Figure 5) shortly after the time of a sighting. Species identifications were validated when possible by photographing the school at close range using 35 mm and video cameras.

During suitable sea states (Beaufort states 0 - 4) and visibility conditions, a Hughes¹ 500D helicopter was used to photograph dolphin schools. The photographs will be used to calibrate dolphin school size estimates made by shipboard observers. We used high resolution 5" format cameras with image motion compensation, which were designed by the Navy for low altitude reconnaissance. The cameras were forward motion compensated to eliminate loss of resolution caused by the movement of the aircraft.

Data Analyses

Sea state conditions were grouped into "calm" conditions, without whitecaps (Beaufort numbers 0-2) or "rough" conditions, with whitecaps (Beaufort numbers 3-6). The presence of whitecaps was important in searching for sighting cues. Animal splashes could not effectively be used as a sighting cue during rough seas because whitecaps were easily confused with the animal splashes.

Visibility conditions were classified into "good" and "poor" categories. Poor visibility conditions were recorded when

horizontal sun position was 12 and vertical position was 1, 2, or 3, or when there were clouds together with fog or rain (Holt, 1987). All other conditions were good conditions.

The study area was divided into four strata, with the sum of the four strata comprising the total study area (Figure 1). The sum of the three northern most strata (inshore, middle and west) constitutes the northern stratum and represents the range of the northern offshore stock of spotted dolphins (the species most impacted by the purse-seine fishery). Data were analyzed using information by stratum, summed over strata and pooled over strata.

The rate of encountering marine mammal schools was determined as the simple ratio of sightings detected per 1000 km searched. The variance of the encounter rate was calculated as

$$\text{Var } (n/L) = [\sum l_i [(n_i/l_i) - (n/L)]^2] / L(R - 1)$$

where n equals the number of dolphin schools detected in the survey, L equals total thousands of km searched, l_i equals thousands of km searched during the i th day, n_i equals schools detected during the i th day, and R equals number of days searched.

Encounter rates were calculated for all dolphin schools that were detected during Beaufort states 0 through 6. Rates were calculated for these schools detected in the entire study area and for schools stratified by area, calm and rough sea conditions, good and poor sun conditions, individual observers, and observer teams.

RESULTS

Data describing each leg of searching effort during the entire survey are summarized in Table 2. Information summarized for each marine mammal sighting encountered during the survey is presented in Table 3. The geographic positions of all schools detected during the survey are presented for each species category (code) in Figures 6 through 19. Observer estimates of school size are presented by species and subspecies in Table 4.

During the entire survey, observers searched 12,711 km and detected 745 marine mammal sightings (Table 5). Dolphins were detected in 514 schools and whales were detected in 218 schools (13 schools contained both dolphins and whales). These included 14 species of dolphins and 17 species of whales.

Searching effort was conducted during Beauforts 0 through 6 conditions. Generally, effort was terminated once the seas and wind attained a force of Beaufort 6, though at times Beaufort 6 conditions were workable. Effort was terminated at the discretion

of the team leader and cruise leader. While operating in the searching mode in the study area (Figure 1) during Beauforts 0 through 6, 12,640 km were searched and 473 dolphin schools were detected. The overall rate of detecting schools in the study area was 37.42 schools/1000 km searched (Table 6).

The Jordan conducted survey effort in only two of the four regions, with approximately 70% of its effort in the inshore area 30% of its effort in the middle area. The detection rate in the inshore stratum was over two times the detection rate in the middle stratum (Table 6).

Sea conditions in the study area were rough. Only 22% of the searching effort was completed in calm seas (Table 6). However, 41% of all schools were detected during calm seas and the rate of detecting schools during calm seas was more than two times the rate detected during rough seas.

Poor visibility conditions occurred during 15% of the surveying effort during which time 12% of the schools were detected (Table 6). The rate of detecting schools during good conditions was greater than the rate during poor conditions (38.72 and 30.31 schools/1000 km searched, respectively).

With two exceptions, all observers spent approximately equal time searching (between 24 and 27% of the total distance searched). Observer #22 spent less time on effort due to a slight injury, and observer #4 stood watch in his place (Table 6). Observer #4 also stood watch when other observers were sick. Observer #4 detected 1% of the schools and also had the highest detection rate (19.28 schools/1000 km).

Excluding observer #4, who spent much less time on effort, the percent of all schools that were detected by the observers ranged from 7 to 11% (Table 6). Consequently, rates of detecting dolphin schools also varied considerably (range of 9.27 to 16.36 schools/1000 km).

The percentage of dolphin schools detected by observer teams ranged from 22 to 27% (Table 6). The rate of detecting schools by teams varied from 33.30 to 43.45 schools/1000km searched.

SUMMARY

In this report, we have presented data on dolphin encounter rates, school size, and species composition which meet the primary objectives of the cruise aboard the Jordan. Data on effort and sightings have been summarized. We found that the rate of encountering dolphin schools was much higher during calm seas than during rough seas, and the rate during good visibility conditions

was substantially higher than the rate during poor visibility conditions. The rate was higher in the inshore area than in the middle area. Encounter rates for individual observers and observer teams were variable.

ACKNOWLEDGEMENTS

The cruise aboard the Jordan was successfully executed due to the work of many dedicated professionals. Among those contributing to the success of the cruise were the observers who spent many hours collecting the data, the officers and crew of the NOAA Ship David Starr Jordan who gave their continuous support, and J. Bortniak (Jordan Port Captain) who provided liaison with ship support personnel and the scientists. William Irwin provided essential technical assistance with cruise preparations. Special efforts were provided in procurement by B. Engstrand and B. Watkins. Part of the manuscript was typed by C. Ratcliffe. We are grateful to I. Barrett, R. Neal, D. DeMaster, R. Holt, and B. Remington for their support during the entire cruise preparation and execution. Finally, special recognition is given to S. Sexton for critical logistical arrangements, technical support, and invaluable insights given to the authors.

Table 6. (continued)

	Distance Searched (km)	Percent Distance Searched	Number Schools Detected	Percent Schools Detected	Detection Rate (Schools/ 1000 km)	S.E. Detection Rate	Number ² Days Searched
Teams ³							
Team 1	2992	24	130	27	43.45	45.82	49
Team 2	3032	24	113	24	37.27	35.03	49
Team 3	3324	26	119	25	35.79	18.17	53
Team 4	3213	25	107	22	33.30	17.75	53

¹Numbers may not add precisely due to rounding.

²Day included in tally of searching effort if variable occurred during any part of the day.

³Team 1 members were observers 1,51,74; Team 2 members were observers 5,22,45; Team 3 members were observers 55,71,73; and Team 4 members were observers 7,56,67. 78km of trackline was searched when either both or neither of the team leaders were on duty and is not used for team analysis.

RECENT TECHNICAL MEMORANDUMS

Copies of this and other NOAA Technical Memorandums are available from the National Technical Information Service, 5285 Port Royal Road, Springfield, VA 22167. Paper copies vary in price. Microfiche copies cost \$4.50. Recent issues of NOAA Technical Memorandums from the NMFS Southwest Fisheries Center are listed below:

- NOAA-TM-NMFS-SWFC- 132 Report of ecosystem studies conducted during the 1988 eastern tropical Pacific dolphin survey on the research vessel *McArthur*.
L.J. LIERHEIMER, P.C. FIEDLER, S.B. REILLY, R.L. PITMAN, L.T. BALLANCE and D.W. BEHRINGER
(June 1989)
- 133 The 1987-88 demersal fish surveys off Central California (34°30'N to 36°30'N)
J.L. BUTLER, C.A. KIMBRELL, W.C. FLERX and R.D. METHOT
(July 1989)
- 134 The First 25 Years.
LILLIAN L. VLYMEN
(September 1989)
- 135 Censuses and interatoll movements of the Hawaiian monk seal on Laysan Island, 1985.
B.L. BECKER, R.J. MORROW, and J.K. LEIALOHA
(September 1989)
- 136 Summary of the 1987 U.S. tuna/porpoise observer data.
A.R. JACKSON
(October 1989)
- 137 Biomass-based models and harvesting policies for Washington-Oregon-California rockfish stocks with correlated recruitment patterns
J.E. HIGHTOWER
(April 1990)
- 138 Effects of including in mortality estimates, dolphins categorized as either injured or of undetermined status.
C.W. OLIVER and E.F. EDWARDS
(May 1990)
- 139 Report of ecosystem studies conducted during the 1989 eastern tropical Pacific dolphin survey on the research vessel *David Starr Jordan*.
L.J. LIERHEIMER, P.C. FIEDLER, S.B. REILLY, R.L. PITMAN, L.T. BALLANCE, S.C. BEAVERS, G.G. THOMAS and D.W. BEHRINGER
(May 1990)
- 140 Report of ecosystem studies conducted during the 1989 eastern tropical Pacific dolphin survey on the research vessel *McArthur*.
L.J. LIERHEIMER, P.C. FIEDLER, S.B. REILLY, R.L. PITMAN, L.T. BALLANCE, S.C. BEAVERS and D.W. BEHRINGER
(May 1990)
- 141 Ichthyoplankton and station data for California cooperative oceanic fisheries investigations survey cruises in 1984.
E.G. STEVENS, R.L. CHARTER, H.G. MOSER and C.A. MEYER
(May 1990)
