NOAA Technical Memorandum NMFS

The National Oceanic and Atmospheric Administration (NOAA), organized in 1970, has evolved into an agency which establishes national policies and manages and conserves our oceanic, coastal, and atmospheric resources. An organizational element within NOAA, the Office of Fisheries is responsible for fisheries policy and the direction of the National Marine Fisheries Service (NMFS).

In addition to its formal publications, the NMFS uses the NOAA Technical Memorandum series to issue informal scientific and technical publications when complete formal review and editorial processing are not appropriate or feasible. Documents within this series, however, reflect sound professional work and may be referenced in the formal scientific and technical literature.

NOAA Technical Memorandum NMFS

This TM series is used for documentation and timely communication of preliminary results, interim reports, or special purpose information; and have not received complete formal review, editorial control, or detailed editing.

REPORT OF A MARINE MAMMAL SURVEY OF THE EASTERN TROPICAL PACIFIC
ABOARD THE RESEARCH VESSEL McARTHUR
JULY 28 - DECEMBER 6, 1990

P. Scott Hill
Alan Jackson
and
Tim Gerrodette

In 1984, as a result of an amendment to the Marine Mammal Protection Act of 1972, the National Marine Fisheries Service (NMFS) was mandated to conduct a research program to monitor trends in the abundance of stocks of dolphins in the eastern tropical Pacific (ETP). These dolphins are killed incidentally during fishing operations by the U. S. purse seine fishery for yellowfin tuna (Thunnus albacares). In 1986, the Southwest Fisheries Science Center (SWFSC) of the NMFS initiated a six-year program to monitor these stocks of dolphins. In the first four years of the program (1986 through 1989), two surveys of marine mammal populations in the ETP were conducted concurrently each year aboard the National Oceanic and Atmospheric Administration vessels David Starr Jordan and McArthur. The surveys lasted 120 days each. In 1990, the fifth pair of surveys was conducted during the same time period and using the same vessels.

In this report, we describe the experimental procedures used during the 1990 surveys and we present summaries of the distance searched and marine mammals encountered from aboard the McArthur (Cruise AR-90-04; SWFSC Observer Cruise 1370). A separate report of the David Starr Jordan cruise has been published by Hill et al. (1991). A report of environmental data collected during the survey is reported by Philbrick et al. (1991).

SURVEY OBJECTIVES

The primary objective of the cruise was to collect information to calculate relative abundance of dolphin species in the ETP that are taken incidentally by the purse seine fishery for yellowfin tuna. Specific objectives were to collect information to:

1. estimate school density, school size, and species composition of each species taken by the fishery;
2. investigate the physical and biological environment of the affected species; and
3. contribute to on-going U.S. and international programs investigating oceanography and ocean-atmosphere interactions in the ETP.

MATERIALS AND METHODS

Study Area and Itinerary

The McArthur followed predetermined tracklines in the ETP from July 28 through December 6, 1990 (Figure 1), with port calls in Hilo, Hawaii; Puerto Caldera, Costa Rica; and Guayaquil, Ecuador. The itinerary of the vessel included four segments or effort legs:

Leg 1.	Departed	San Diego	July 28
	Arrived	Hilo	August 26
Leg 2.	Departed	Hilo	August 31
	Arrived	Puerto Caldera	September 29
Leg 3.	Departed	Puerto Caldera	October 4
	Arrived	Guayaquil	November 2
Leg 4.	Departed	Guayaquil	November 7
	Arrived	San Diego	December 6

Scientific personnel aboard the McArthur also conducted bird censuses on Isla del Coco (Costa Rica) and Isla de Guadalupe (Mexico).

Oceanographic data were collected by the McArthur survey department personnel.

Marine Mammal Species Surveyed

During the survey, the observers recorded information on all species of whales and dolphins sighted throughout the cruise. However, encounter rates are presented only for dolphin species.

Equipment

The McArthur, commissioned in 1966, is 53.3 m in length, has a beam of 11.6 m, and has a 3.7 m draft. During the surveys, the vessel maintained a cruising speed of approximately 18.5 km/hr.

Several pieces of equipment were used to gather data. The geographic position of the vessel was recorded periodically and at the time of a marine mammal sighting using the vessel's Satellite Navigation System (SATNAV). Marine mammals were detected with port and starboard pedestal mounted 25X Fuginon¹ binoculars and a variety of hand-held 7x50 binoculars. The glasses were mounted on the upper deck approximately 10.7 m above the sea surface. Surface temperature and salinity, and temperature profiles were obtained using a thermosalinograph and expendable bathythermographs (XBTs), respectively. Salinity and temperature profiles were obtained using conductivity-temperature-depth (CTD) device. Water samples collected during these casts were analyzed for chlorophyll, salinity, nutrients, and primary productivity (using a C-14 uptake

¹Reference to trade name does not imply endorsement by the NMFS.

method).

The bearing and radial distance from the vessel to each sighted marine mammal school was recorded. The bearing from the vessel to the school was recorded by the observers using a 360° graduated washer attached to the base of the 25X binoculars. The distance was determined by utilizing graduated reticles enclosed in the right eyepiece of the 25X binoculars.

Replicate angle and distance measurements to objects (buoys and points of land) were recorded opportunistically utilizing the 25X binoculars and the ship's radar. Analyses of these data will be covered in another report.

A 35 mm F-1 Canon¹ camera with motor drive was used to photograph animals to aid in stock and species identification. The system included 400 mm, 70-210 mm zoom, 50 mm, and 28 mm lenses. Some observers also used personal camera equipment to photograph sightings. Animals were also recorded on 1.27 cm video tape using a Panasonic¹ VHS recorder and a Panasonic¹ camera equipped with a telephoto lens.

Duty Stations

Three duty stations were used during the survey, with observers rotating through each station.

1. Left Binocular - The port-side observer used a 25X binocular, mounted on the port side of the vessel, to scan the ocean for marine mammal sighting cues. The major area of responsibility for this observer was from the midpoint of the trackline to abeam the port side of the vessel and outward to the horizon or to the extent possible with prevailing environmental conditions.
2. Right Binocular - The starboard observer used a 25X binocular, mounted on the starboard side of the vessel, to search from the midpoint of the trackline to abeam the starboard side of the vessel, and outward to the horizon or to the extent possible with prevailing environmental conditions. Observers in the left and right positions frequently searched up to 10° on the opposite side of the trackline.
3. Recorder - The recorder's duties were to transcribe effort data at regular intervals, to make notes of information pertaining to each sighting, and to search the trackline adjacent to the vessel with hand held binoculars for schools not detected by the observers on the 25X glasses.

Observer Teams and Rotation

Two teams of three observers each alternately occupied the three duty stations. Each team was on duty for a two-hour shift. During each shift, observers spent approximately equal time occupying each duty station. Teams alternated standing the first watch of the day.

Two of the six observers, one on each team, were experts in identifying marine mammals. Team composition remained constant during the entire survey. Team members rotated between the duty stations and teams rotated on and off duty without interrupting searching effort. Observers aboard the Jordan and McArthur switched vessels after the second leg, allowing school size estimates for all observers to be calibrated with the ship-based helicopter on the Jordan.

Data Collection Procedures

A typical day's searching activity began at sunrise, approximately 0630 hours local time, and ended at sunset, approximately 1830 hours local time. The searching procedure was initiated when observers were occupying the duty stations and a recorder was in place to record information on the Research Vessel Effort Form (Figure 2). Except for approximately two to three hours per night when oceanographic data were collected, the vessel maintained its speed and course between sunset and sunrise to provide wider spatial distribution of searching effort. On approximately one-third of the nights, the McArthur was forced to steam at a slightly reduced speed in order to conserve fuel.

When a sighting cue (marine mammals, birds, splashes, etc.) was detected, it was determined whether marine mammals were present and if the sighting was appropriate to approach. Generally, all marine mammal schools (dolphins and whales) encountered within 5.6 km lateral to the vessel were deemed as appropriate to turn on. For these schools, the searching effort was terminated and the vessel was directed to intersect the school. In order for the observers to obtain estimates of school size and species composition. The searching mode was resumed after the vessel returned to its original course and speed and the observers resumed searching for other sighting cues.

During each marine mammal sighting, the recorder collected data necessary to complete Research Vessel Effort and Research Vessel Sighting forms (Figure 3). Definition of each data element is given by Ralston². Criteria for assigning sun position and sea

²Ralston, F. Ms. Usage procedures and coding notes for research vessel sighting and effort records. Southwest Fisheries Center. P.O. Box 271, La Jolla, CA. 92038.

state conditions are given in Figure 4 and Table 1, respectively. Observers recorded bearing and range to the mammals using the 360° washer and reticles etched into the right eyepieces of the 25 power binoculars. The reticle measurements were converted to km using

$$a = 0.003942 \tan (\arctan (45242.52) - 0.001088 r),$$

where a equals radial distance in km and r denotes the number of reticles below the topmost reticle. Values in this equation were calculated by Barlow (per. comm.) using an equation presented by Smith (1982) and data collected during previous research vessel cruises.

Each observer who had a good view of the school independently recorded in his or her logbook high, low and best estimates of school size and a determination of species composition. At no time were the observers allowed to discuss their estimates of school size and species composition. This procedure assured independence and consistency of each observer's data, and will allow individual correction factors to be developed from aerial photographs. On a daily basis, the Cruise Leader (chief of the scientific party on the vessel) collected the individual logbooks and transcribed observer estimates of school size and species composition to complete the Research Vessel Sighting Forms.

All available observers, however, were allowed to discuss species identification and animal behavior, and a consensus was entered on the Research Vessel Sighting and Research Vessel Continuation Forms (Figure 5) shortly after the time of a sighting. Species identifications were validated when possible by photographing the school at close range using 35 mm and video cameras.

Data Analyses

Sea state conditions were grouped into "calm" conditions, without whitecaps (Beaufort numbers 0-2), or "rough" conditions, with whitecaps (Beaufort numbers 3-5). The presence of whitecaps was important in searching for sighting cues. Animal splashes could not effectively be used as a sighting cue during rough seas because whitecaps were easily confused with the animal splashes.

Visibility conditions were classified into "good" and "poor" categories. Poor visibility conditions were recorded when horizontal sun position was 12 and vertical position was 1, 2, or 3, or when there were clouds together with fog or rain (Holt 1987). All other conditions were considered good conditions.

The study area was divided into four strata, with the sum of the four strata comprising the total study area (Figure 1). The sum of the three northern most strata (inshore, middle and west) constitutes the northern stratum and represents the range of the

northern offshore stock of spotted dolphins (the species most impacted by the purse-seine fishery). Data were analyzed using information by stratum, summed over strata and pooled over strata.

The rate of encountering marine mammal schools was determined as the simple ratio of sightings detected per 1000 km searched. The variance of the encounter rate was calculated as

$$\text{Var}(n/L) = [\sum l_i [(n_i/l_i) - (n/L)]^2] / L(R - 1)$$

where n equals the number of dolphin schools detected in the survey, L equals total thousands of km searched, l_i equals thousands of km searched during the i th day, n_i equals schools detected during the i th day, and R equals number of days searched.

Encounter rates were calculated for all dolphin schools that were detected during Beaufort states 0 through 5. Rates were calculated for these schools detected in the entire study area and for schools stratified by area, species, individual Beaufort numbers, calm and rough sea conditions, good and poor sun conditions, individual observers, and observer teams.

RESULTS

Data describing each leg of searching effort during the entire survey are summarized in Table 2. Information summarized for each marine mammal sighting encountered during the survey is presented in Table 3. The geographic positions of all schools detected during the survey are presented for each species category (code) in Figures 6 through 19. Observer estimates of school size are presented by species and subspecies in Table 4.

During the entire survey, observers searched 18,997 km and made 517 marine mammal sightings (Table 5). Dolphins were detected in 303 schools and whales were detected in 214 schools (22 schools contained both dolphins and whales). These included 11 species of dolphins and 16 species of whales.

Searching effort was conducted during Beauforts 0 through 5 conditions. Generally, effort was terminated shortly after the seas and wind attained a force of Beaufort 6. Effort was terminated at the discretion of the team leader and the cruise leader. While operating in the searching mode in the study area (Figure 1), 17,819 km were searched and 272 dolphin schools were detected. The overall rate of detecting schools in the study area was 15.26 schools/1000 km searched (Table 6).

Searching effort of the McArthur was distributed among all four strata, with the highest percentage of effort (36%) occurring in the southern area (Table 6). The detection rates varied among the four strata (from 19.76 to 12.60 schools/1000 km searched).

The detection rate was highest in the inshore area and lowest in the western area (Table 6).

Sea conditions in the study area were extremely rough. Only 6% of the searching effort was completed in calm seas (Table 6). However, 11% of all schools were detected during calm seas and the rate of detecting schools during calm seas was nearly two times the detection rate during rough seas.

Poor visibility conditions occurred during 23% of the surveying effort, during which time 29% of the schools were detected (Table 6). It seems that visibility conditions had little effect on sighting dolphin schools as the rate of detecting schools during poor conditions was actually higher than the rate of detection during good conditions.

The percentage of schools detected by each mammal observer ranged from 4 to 13% (Table 6). The rates of detecting dolphin schools also varied considerably among observers (range of 2.27 to 7.33 schools/1000 km).

The percentage of schools detected by each team ranged from 21 to 28% (Table 6). The rate of detecting schools by teams ranged from 13.14 to 19.72 schools/1000 km searched.

SUMMARY

In this report, we have presented data on dolphin encounter rates, school size, and species composition which meet the primary objectives of the cruise aboard the McArthur. Data on effort and sightings have been summarized. We found that the rate of encountering dolphin schools was higher during calm seas than during rough seas, and the rate during good visibility conditions was lower than the encounter rate during poor visibility conditions. Detection rates were highest in the inshore area and lowest in the western area. Encounter rates among observers and among teams were variable.

ACKNOWLEDGMENTS

The cruise aboard the NOAA Ship McArthur was successfully executed due to the work of many dedicated professionals. Among those contributing to the success of the cruise were the marine mammal observers who spent many long hours collecting the data and especially the officers and crew of the McArthur who gave their continuous support. Special recognition should be given to the survey department personnel of the McArthur who exceeded our data gathering expectations. Special efforts were provided in

procurement by B. Engstrand and B. Watkins. Many of the figures were provided by J. Tran. R. Rasmussen edited the effort and sightings data. We are grateful to I. Barrett, R. Neal, D. DeMaster, R. Holt, and B. Remington for their support during the entire cruise preparation and execution. Finally, special recognition is given to S. Sexton for her technical support and invaluable insights given to the authors.

Table 6. (continued)

	Distance Searched (km)	Percent Distance Searched	Number Schools Detected	Percent Schools Detected	Detection Rate (Schools/ 1000 km)	S.E. Detection Rate	Number ² Days Searched
Teams ⁴							
Team 1	3905	22	77	28	19.72	10.66	51
Team 2	4261	24	56	21	13.14	7.85	51
Team 3	4922	28	74	27	15.03	4.67	53
Team 4	4674	26	64	24	13.69	4.52	53

¹Numbers may not add precisely due to rounding.

2Day included in tally of searching effort if variable occurred during any part of the day.

³Observers 81 and 83 searched 82 km and 197 km of trackline, respectively, while substituting for sick personnel.

⁴Team 1 members were observers 1,74,76; Team 2 members were observers 7,22,75; Team 3 members were observers 55,71,77; and Team 4 members were observers 56,67,69. 57km of trackline was searched when either both or neither of the team leaders were on duty and is not used for team analysis.

Figure 1. Tracklines surveyed by the NOAA ship McArthur from July 28 through December 6, 1990, in the eastern tropical Pacific.

Figure 12. Rough-toothed dolphins (+) detected from aboard the NOAA Ship McArthur from July 28 through December 6, 1990, in the eastern tropical Pacific.

Figure 13. Unidentified (+) and short-finned (o) pilot whales detected from aboard the NOAA Ship McArthur from July 28 through December 6, 1990, in the eastern tropical Pacific.

Figure 14. Sperm (+), dwarf sperm (o) and unidentified sperm (dwarf/pygmy; □) whales detected from aboard the NOAA Ship McArthur from July 28 through December 6, 1990, in the eastern tropical Pacific.

Figure 15. Unidentified rorqual (+), Bryde's (o), blue (v), minke (□), humpback (o) and unidentified (sei/Bryde's; x) whales detected from aboard the NOAA Ship McArthur from July 28 through December 6, 1990, in the eastern tropical Pacific.

Figure 16. Unidentified beaked (+), Cuvier's beaked (o), unidentified mesoplodon (v) and Blaineville's beaked (Δ) whales detected from aboard the NOAA Ship McArthur from July 28 through December 6, 1990, in the eastern tropical Pacific.

Figure 17. Killer (+) and false killer (◻) whales, Fraser's dolphins (▽) and melon-headed (◻), pygmy killer (o) and unidentified (melon-headed/pygmy killer; x) whales detected from aboard the NOAA Ship McArthur from July 28 through December 6, 1990, in the eastern tropical Pacific.

Figure 18. Unidentified dolphins (+) detected from aboard the NOAA Ship McArthur from July 28 through December 6, 1990, in the eastern tropical Pacific.

Figure 19. Unidentified small whales (+), unidentified whales (o), unidentified large whales (v) and unidentified cetaceans (□) detected from aboard the NOAA Ship McArthur from July 28 through December 6, 1990, in the eastern tropical Pacific.

RECENT TECHNICAL MEMORANDUMS

Copies of this and other NOAA Technical Memorandums are available from the National Technical Information Service, 5285 Port Royal Road, Springfield, VA 22167. Paper copies vary in price. Microfiche copies cost \$4.50. Recent issues of NOAA Technical Memorandums from the NMFS Southwest Fisheries Science Center are listed below:

NOAA-TM-NMFS-SWFSC- 149 Summary of the 1988 U.S. tuna/porpoise observer data.

A.R. JACKSON
(September 1990)

150 Population monitoring of the Hawaiian Monk Seal, *Monachus schauinslandi*, and captive maintenance project at Kure Atoll, 1988.

J.R. HENDERSON and M.R. FINNEGAN
(September 1990)

151 The Hawaiian Monk Seal on Laysan Island, 1988.

T.C. JOHANOS, B.L. BECKER, M.A. BROWN, B.K. CHOY,
L.M. HURUKI, R.E. BRAINARD and R.L. WESTLAKE
(September 1990)

152 A personal computer based system for analog-to-digital and serial communication data acquisition.

R.C. HOLLAND
(November 1990)

153 The nearshore physical oceanography off the central California coast during May-June, 1989: A summary of CTD from juvenile rockfish surveys.

F.B. SCHWING, S. RALSTON, D.M. HUSBY and W.H. LENARZ
(December 1990)

154 Proceedings of the second international conference on marine debris 2-7 April, 1989, Honolulu, Hawaii. Volumes I & II.

R.S. SHOMURA and M.L. GODFREY (Editors)
(December 1990)

155 The Hawaiian Monk Seal, *Monachus schauinslandi*, at Kure Atoll, 1982-83.

C.E. BOWLBY, P.D. SCOGGINS, R.T. WATSON and M.L. REDDY
(February 1991)

156 Research plan for marine turtle fibropapilloma results of a December 1990 workshop.

G.H. BALAZS and S.G. POOLEY (Editors)
(February 1991)

157 Documentation of the 1980 data verification programs and common subroutines for fixed-format data: Porpoise data management system.

C.W. OLIVER and R.L. BUTLER
(March 1991)

158 Report of a marine mammal survey of the eastern tropical Pacific aboard the research vessel *David Starr Jordan*, July 28-December 6, 1990.

P.S. HILL, R.C. RASMUSSEN and T. GERRODETTE
(May 1991)
