CUMACEA

Family: Bodotriidae

(By N. S. Jones)

1957

1. Family BODOTRIIDAE T. Scott

Key to Species:

1. Peraeopods 1—4 of the male and 1—3 of the female with well developed or rudimentary exopodites Sub-family Vaunthompsoniinae 2
Only the first pair of peraeopods with exopodites in either sex Sub-family Bodotriinae 5
2. All the exopodites well developed (Fig. 14) *Vaunthompsonia cristata* 3
The exopodites of peraeopods 2—3 rudimentary (Fig. 15) 3
3. Carapace with 2 pairs of lateral folds (Fig. 16) *Cumopsis goodsiri*
Carapace without lateral folds (Fig. 17) 4
4. The inner ramus of the uropod with only one stout spine at the end of the second joint (Fig. 19) *Cumopsis fagei*
The inner ramus of the uropod with several lateral and one thin apical spine on the second joint (Fig. 18)
..... *Cumopsis longipes* 6
5. The first thoracic somite visible from above (Fig. 20) 6
The first thoracic somite not visible and fused to the carapace (Fig. 21) 8
6. The first antenna with 2 aesthetascs (Figs. 22, 23) *Iphinoe serrata*
The first antenna with 1 aesthetasc (Fig. 24) 7
7. The basis of the first peraeopod much shorter than the remaining joints together (Figs. 25, 26) *Iphinoe tenella*
The basis of the first peraeopod longer than the remaining joints together (Figs. 20, 27) *Iphinoe trispinosa*
8. Carapace with lateral horns, the peduncle of the uropods much shorter than the rami (Fig. 28) 9
Carapace without lateral horns; peduncle of the uropods much longer than the rami (Fig. 21) 10
9. Carapace with a pair of lateral carinae (Fig. 28) *Eocuma dollfusi*
Carapace without lateral carinae (Fig. 29) *Eocuma ferox*
10. Carapace with 2 pairs of lateral carinae (Fig. 30) *Bodotria pulchella*
Carapace with 1 pair of lateral carinae (Fig. 21) 11
11. The inner ramus of the uropod 2-jointed (Fig. 32) *Bodotria scorpioides*
The inner ramus of the uropod 1-jointed (Fig. 31) *Bodotria arenosa*

Sub-Family VAUNTHOMPSONIINAE Hale

Genus VAUNTHOMPSONIA Bate

Peraeopods 1—4 of the ♂ and 1—3 of the ♀ with well developed exopodites; basis of the 3rd maxilliped little or not prolonged distally; eyes well developed.

1. *V. cristata* Bate 1858. (Fig. 14). ♀ with toothed crest on carapace; ♂ carapace smooth; last abdominal somite serrated posteriorly. Coastal species, ♂ attracted to light at night. Length about 5—6 mm. — G. O. Sars, 1879, Pl. XXIII—XXVI. F a g e, 1951, Figs. 17—18.

Genus CUMOPSIS G. O. Sars

Peraeopods 2 and 3 with rudimentary exopodites; ♂ first antenna with a circlet of sensory hairs; eyes well developed.

2. *C. goodsiri* (v. Beneden 1861). (Figs. 15—16). Carapace with lateral folds sometimes faintly defined; 2nd thoracic tergite of ♀ with a pair of semicircular folds. Intertidal or in very shallow water. ♂ occasionally caught in light traps. Length about 5—6 mm. — G. O. Sars, 1879, Pl. XIX—XXI. F a g e, 1951, Figs. 20—22.
3. *C. longipes* (Dohrn 1869). (Figs. 17—18). Very shallow water. Length about 6 mm. — G. O. Sars, 1879, Pl. XXII, as *C. laevis*. F a g e, 1951, Fig. 23.
4. *C. fagei* Bacescu 1956. (Fig. 19). Very shallow water. Length about 5—8 mm. — B a c e s c u, 1956, Fig. 1.

Sub-Family BODOTRIINAE Hale

Genus BODOTRIA Goodsir

Integument strongly calcified; first pedigerous somite not visible above; the 2nd longer than the following; peduncle of the uropods much longer than the rami.

5. *B. scorpioides* (Montagu 1804). (Figs. 11, 32). Length about 5—6 mm. Shallow water, ♂ attracted to light. — G. O. Sars, 1879, Pl. I—III, as *Cuma edwardsii*. G. O. Sars, 1900, Pl. IV, as *Cuma edwardsii*. Fage, 1951, Figs. 25—26.
6. *B. arenosa* Goodsir 1843. (Figs. 5, 7, 21, 31). Coastal species. Length about 7 mm. — G. O. Sars, 1900, Pl. I—III, as *Cuma scorpioides*.
7. *B. pulchella* (G. O. Sars 1879). (Fig. 30). Coastal species. Length about 2—3 mm. — G. O. Sars, 1879, Pl. VI and LX, as *Cuma pulchella*. Fage, 1951, Figs. 27—28.

Genus EOCUMA Marcusen

Integument strongly calcified; carapace with lateral horns at least in the ♂; peduncle of the uropods much shorter than the rami.

8. *E. dollfusi* Calman 1907. (Fig. 28). Intertidal. Length about 5—7 mm. — Calman, 1907, Figs. 2—4. Fage, 1951, Fig. 36. Le Sueur, 1955, Pl. I—III.
9. *E. ferox* (P. Fischer 1872). (Fig. 29). Intertidal and shallow water, ♂ attracted to light. Length about 5—6 mm. — G. O. Sars, 1879, Pl. VII—IX. Fage, 1951, Figs. 33—34.

Genus IPHINOE Bate

Body long and slender; carapace compressed and with a dorsal carina; pseudorostrum prominent; first pedigerous somite visible above.

10. *I. trispinosa* (Goodsir 1843). (Figs. 20, 27). ♀ carapace with few teeth on the dorsal carina; ♂ without teeth. Intertidal and coastal species, ♂ attracted to light. Length about 9—10 mm. — G. O. Sars, 1900, Pl. V—VI. Fage, 1951, Figs. 37, 38, 45.
11. *I. tenella* G. O. Sars 1879. (Figs. 24—26). Carapace with a row of prominent teeth, usually in both sexes. Intertidal and shallow water, ♂ attracted to light. Length about 7—8 mm. — G. O. Sars, 1879, Pl. XV—XVI, and as *I. gracilis* and *I. serrata*. Fage, 1951, Figs. 40—42, 45.
12. *I. serrata* Norman 1867. (Figs. 22—23). Carapace with a row of small teeth in both sexes. Usually in moderate depths. Length about 8—12 mm. — Fage, 1951, Figs. 43—45.

References are given in Sheet 71 and Figures in Sheet 72.

Distribution	Species
Baltic proper	—
Belt Sea	5
